or other construction projects are now being used. Such areas include problematic soil regions, mining subsidence areas, and sanitary landfills. To overcome the problems associated with these natural or man-made soil deposits, new and improved methods of analysis, design, and implementation are needed in foundation construction. As society develops and living standards rise, tall buildings, transportation facilities, and industrial complexes are increasingly being built. Because of the heavy design loads and the complicated environments, the traditional design concepts, construction materials, methods, and equipment also need improvement. Further, recent energy and material shortages have caused additional burdens on the engineering profession and brought about the need to seek alternative or cost-saving methods for foundation design and construction.

Numerical Methods in Geotechnical Engineering Helmut F. Schweiger, 2006. Numerical Methods in Geotechnical Engineering contains the accepted papers for the 6th European Conference on Numerical Methods in Geotechnical Engineering, Graz, Austria, 6-8 September 2006. They cover a wide range of topics in the field of computational geotechnics, providing a state-of-the-art overview on recent developments in constitutive modelling, numerical implementation, issues coupled and dynamic analysis, and a special session on numerical modelling of ground improvement techniques.
