obtained by simulation more quickly effec Computer simulation of dynamic systems is a topic which is growing steadily in importance tively and cheaply than by experimentation and testing of the real system System perfor in the physical sciences engineering biology and medicine The reasons for this trend mance can also be investigated using simula relate not only to the steadily increasing tion for a much wider range of conditions than can be contemplated for the real system power of computers and the rapidly falling costs of

hardware but also to the availability because of operating constraints or safety of appropriate software tools in the form of requirements. Similar factors can apply in simulation languages. Problem oriented languages in other fields such as biomedical systems languages of this kind assist those who are not engineering specialists in computational methods to transform system simulation using digital computers can relate either to models based on continuous mathematical description into a simulation program in a simple and straightforward manner using variables or to discrete event descriptions. They can also provide useful diagnostic information when difficulties are encountered. Therefore a simulation language can handle differential equations and algebraic equations.

Digital Computer Applications to Process Control M. Paul, 2016-11-04 Considers the application of modern control engineering on digital computers with a view to improving productivity and product quality easing supervision of industrial processes and reducing energy consumption and pollution.
