Theoretical Foundations Of Computer Vision:

Theoretical Foundations of Computer Vision Walter Kropatsch, Reinhard Klette, Franc Solina, R. Albrecht, 2012-12-06

Computer Vision is a rapidly growing field of research investigating computational and algorithmic issues associated with image acquisition processing and understanding. It serves tasks like manipulation, recognition, mobility, and communication in diverse application areas such as manufacturing, robotics, medicine, security, and virtual reality. This volume contains a selection of papers devoted to theoretical foundations of computer vision covering a broad range of fields: e.g. motion analysis, discrete geometry, computational aspects of vision processes, models, morphology, invariance, image compression, 3D reconstruction of shape. Several issues have been identified to be of essential interest to the community: non-linear operators, the transition between continuous to discrete representations, a new calculus of non-orthogonal partially dependent systems.

Computer Vision Franc Solina, Walter Kropatsch, Reinhard Klette, Ruzena Bajcsy, 2012-12-06 Computer vision solutions used to be very specific and difficult to adapt to different or even unforeseen situations. The current development is calling for

simple to use yet robust applications that could be employed in various situations This trend requires the reassessment of some theoretical issues in computer vision A better general understanding of vision processes new insights and better theories are needed The papers selected from the conference staged in Dagstuhl in 1996 to gather scientists from the West and the former eastern block countries address these goals and cover such fields as 2D images scale space morphology segmentation neural networks Hough transform texture pyramids recovery of 3 D structure shape from shading optical flow 3 D object recognition and how vision is integrated into a larger task driven framework hand eye calibration navigation perception action cycle
