Multidimensional Signal and Color Image Processing Using Lattices Eric Dubois,2019-03-12 An Innovative Approach to Multidimensional Signals and Systems Theory for Image and Video Processing In this volume Eric Dubois further develops the theory of multi D signal processing wherein input and output are vector value signals With this framework he introduces the reader to crucial concepts in signal processing such as continuous and discrete domain signals and systems discrete domain periodic signals sampling and reconstruction light and color random field models image representation and more While most treatments use normalized representations for non rectangular sampling this approach obscures much of the geometrical and scale information of the signal In contrast Dr Dubois uses actual units of space time and frequency Basis independent representations appear as much as possible and the basis is introduced where needed to perform calculations or implementations Thus lattice theory is developed from the beginning and rectangular sampling is treated as a special case This is especially significant in the treatment of color and color image processing and for discrete transform representations based on symmetry groups including fast computational algorithms Other features include An entire chapter on lattices giving the reader a thorough grounding in the use of lattices in signal processing Extensive treatment of lattices as used to describe discrete domain signals and signal periodicities Chapters on sampling and reconstruction random field models symmetry invariant signals and systems and multidimensional Fourier transformation properties Supplemented throughout with MATLAB examples and accompanying downloadable source code Graduate and doctoral students as well as senior undergraduates and professionals working in signal processing or video image processing and imaging will appreciate this fresh approach to multidimensional signals and systems theory both as a thorough introduction to the subject and as inspiration for future research

Two-dimensional Signal Processing with Application to Image Restoration T. Assefi, 1974

Two-dimensional Imaging Ronald Newbold Bracewell, 1995 Telecommunication by radio shrank the world to a global village and the satellite and computer have made imagery the language of that village. The creation of images was once mainly in the hands of artists and scribes. Two dimensional images also occur naturally: a shadow, the dappled light pattern under a tree, the optical image on a retina. Nature provided the motif for much abstract ornamentation and our written letters and ideograms trace back to representations of nature.

Realization Theory and Design of Digital Images Yasumichi Hasegawa, Tatsuo Suzuki, 2006-10-18 This monograph deals with the description and design of digital images. Regarding digital images as special input-output relations in our previous book with LNCIS series, the description problem of digital images is transformed into the realization problem of digital images. From the data in digital images, mathematical models will be constructed. Then new systems which describe faithfully any digital images provide new results and their extensions which design digital images. As concerned with mathematical models for digital images, this monograph introduces 2 Commutative Linear Representation Systems for two dimensional images and 3 Commutative Linear Representation Systems for three dimensional images. This monograph is intended for researchers and graduate students who specialized in image processing and system theory.
