Winter Warming:

Responses to Climate Change in the Cold Biomes Hans J. De Boeck, Erika Hiltbrunner, Anke Jentsch, Vigdis Vandvik, 2019-06-05

Climate change is thought to be especially relevant to ecosystems in the cold biomes. Observed warming has been higher in cold climates through various positive feedbacks, especially declining snow and ice cover, and climate projections indicate further rapid warming in the decades to come. Temperature change can have profound impacts in cold biome ecosystems either directly in terms of impacts on physiology or growing season length or indirectly via changes in nutrient cycling. The regions focused on here are the sub-arctic and the sub-alpine areas, both characterized by short growing seasons and low annual temperatures but with different radiation environments depending on latitude. Climate change can have impacts in all seasons. Increased spring temperatures can accelerate snowmelt, leading to an earlier onset of the growing season, while warmer summers may stimulate primary productivity through temperatures closer to metabolic optima and/or increased mineralization rates. Winter warming can lead to the vegetation being damaged because of exposure to harsh frost without insulating snow cover. In all of this, concurrent changes in precipitation also play an important role: increased snowfall can buffer warming-induced advances in snowmelt, a higher ratio of rain to snow can greatly accelerate snowmelt in winter and spring, and summer drought may reverse growth stimulation by warming directly through drought stress or indirectly, e.g., impaired nutrient uptake. Microclimate is crucial in these systems and requires particular attention as it can vary widely across the landscape, creating different growing environments in the space of a few meters or even less. Interest in cold region responses to climate change does not only arise from the fact that they harbor unique ecosystems that may be endangered but also because they store large amounts of carbon that may be released under climate change. However, research is challenging because of the remoteness of many of these areas and the harsh conditions during much of the year. In spite of this, some studies have been carried out over an extensive period spanning decades and yielding information on, for example, plant community reorganization, including invasions and changes in phenology, above and/or belowground. Other studies focus on shorter-term effects such as impacts of heat waves, late frosts, or other anomalous weather, including longer-term after-effects that may differ drastically from other regions because of the short growing season in cold climates. Ultimately, models are used to predict future changes in vegetation along latitudinal or elevational gradients, although phenology and microclimatic variation may pose particular challenges. Contributions to this Research Topic focus on climate change encompassing both changes in the mean (gradual warming and variability, heat waves) and altered precipitation distribution in cold biomes. The Topic contains reports on observed changes or events but also research making use of experimentally imposed environmental changes. The focus is varied, including phenology, physiology, soil and vegetation science, and biogeochemistry, with the aim of providing a comprehensive overview of observed and expected responses to climate change in cold biome ecosystems.

Satellite Remote Sensing and the Management of Natural Resources Nathalie

Pettorelli,2019-05-16 The ability to anticipate the impacts of global environmental changes on natural resources is fundamental to designing appropriate and optimised adaptation and mitigation strategies However this requires the scientific community to have access to reliable large scale information on spatio temporal changes in the distribution of abiotic conditions and on the distribution structure composition and functioning of ecosystems Satellite remote sensing can provide access to some of this fundamental data by offering repeatable standardised and verifiable information that is directly relevant to the monitoring and management of our natural capital This book demonstrates how ecological knowledge and satellite based information can be effectively combined to address a wide array of current natural resource management needs By focusing on concrete applied examples in both the marine and terrestrial realms it will help pave the way for developing enhanced levels of collaboration between the ecological and remote sensing communities as well as shaping their future research directions Satellite Remote Sensing and the Management of Natural Resources is primarily aimed at ecologists and remote sensing specialists as well as policy makers and practitioners in the fields of conservation biology biodiversity monitoring and natural resource management

Coastal Lagoons Michael J. Kennish,Hans W. Paerl,2010-06-15 Written by an outstanding group of contributors this book

examines the function and structure of coastal lagoonal ecosystems and the natural and anthropogenic drivers of change that affect them most notably nutrient over enrichment from coastal watersheds and airsheds The contributors target the susceptibility of coastal lagoons to eutrophication the indicators of eutrophic conditions the influences of natural factors such as major storms and other climate effects and the resulting biotic and ecosystem impairments that have developed The book compares biogeochemical and ecological response to nutrient enrichment and other pollutants in lagoonal estuaries to those in other estuarine types

First Twenty-fifth Report of the National Committee on Wood Utilization [and Supplement to No. 24] National Committee on Wood Utilization (U.S.),1929 **Global Warning ... Global Warming** Melvin A. Benarde,1992-05-11 To understand and constructively participate in the current debate on global warming and its consequences it is essential to have a guide to the playing field Dr Melvin A Benarde s book is this guide and more It is in fact a Baedeker through the minefields of uncertainty which currently bedevil much of the discussion on global warming He contends that predictions of global warming and its consequences generated by mathematical models are too often taken as holy writ When in fact he states they can only be seen as tentative Anything else severely tortures the data Without this rendering the current discussions border on babble Bias prejudice and hidden agendas are everywhere and can be obstacles and pitfalls for the unprepared and unwary By no means does he shrug off the idea of a possible warming trend Dr Benarde takes this fully into account and discusses in generous detail the alternatives reasonable people would pursue in the face of prodigious uncertainty Consequently the book goes well beyond any of the others currently in print in describing the shortcomings of the warming thesis why the stable climate of the past 10 000 years may or may not change as well as the advantages and disadvantages of a warmer world Clearly this fully documented book is essential reading for anyone interested in understanding the panoply of issues inherent in the possibility of climate change and contributes to much needed meaningful dialog
