

Boosting the fascination of fundamental physics

An essay

Christoph Schiller^{*} 

March 2023

Abstract

In contrast to the progress in all other sciences, progress in fundamental theoretical physics has been slow for the last five decades. Why were so many efforts in vain? There are six reasons. The first reason was the insistence to use points to describe particles and space. Five additional habits of thought slowed down fundamental theoretical physics even more.

The present essay argues that all six delaying habits can be eliminated in exactly the same way: points need to be substituted by a different kind of fundamental concept. The new concept is provided by the common constituents of space, black holes, particles, wave functions, and forces. Distilling the correct constituents allows answering the open questions of fundamental physics – including the origin of all colours around us.
