The Interpretation Of Visual Motion Artificial Intelligence:

The Interpretation of Visual Motion Shimon Ullman,1979-02-01 This book uses the methodology of artificial intelligence to investigate the phenomena of visual motion perception how the visual system constructs descriptions of the environment in terms of objects their three dimensional shape and their motion through space on the basis of the changing image that reaches the eye The author has analyzed the computations performed in the course of visual motion analysis Workable schemes able to perform certain tasks performed by the visual system have been constructed and used as vehicles for investigating the problems faced by the visual system and its methods for solving them Two major problems are treated first the correspondence problem which concerns the identification of image elements that represent the same object at different times thereby maintaining the perceptual identity of the object in motion or in change The second problem is the three dimensional interpretation of the changing image once a correspondence has been established The author s computational approach to visual theory makes the work unique and it should be of interest to psychologists working in visual perception and readers interested in cognitive studies in general as well as computer scientists interested in machine vision theoretical neurophysiologists and philosophers of science   The Interpretation of Visual Motion Shimon Ullman,1979 This book uses the methodology of artificial intelligence to investigate the phenomena of visual motion perception how the visual system constructs descriptions of the environment in terms of objects their three dimensional shape and their motion through space on the basis of the changing image that reaches the eye The author has analyzed the computations performed in the course of visual motion analysis Workable schemes able to perform certain tasks performed by the visual system have been constructed and used as vehicles for investigating the problems faced by the visual system and its methods for solving them Two major problems are treated first the correspondence problem which concerns the identification of image elements that represent the same object at different times thereby maintaining the perceptual identity of the object in motion or in change The second problem is the three dimensional interpretation of the changing image once a correspondence has been established The author s computational approach to visual theory makes the work unique and it should be of interest to psychologists working in visual perception and readers interested in cognitive studies in general as well as computer scientists interested in machine vision theoretical neurophysiologists and philosophers of science   Experiments in the Machine Interpretation of Visual Motion David W. Bach,J.K. Aggarwal,2012-12-06 The physical processes which initiate and maintain motion have been a major concern of serious investigation throughout the evolution of scientific thought As early as the fifth century B C questions regarding motion were presented as touchstones for the most fundamental concepts about existence Such wide ranging philosophical issues are beyond the scope of this book however consider the paradox of the flying arrow attri buted to Zeno of Elea An arrow is shot from point A to point B requiring a sequence of time instants to traverse the distance Now for any time instant T of the sequence the arrow is at a position Pi and at Ti the i arrow is at Pi i with Pi I P Clearly each Ti must be a singular time i 1 unit at which the arrow is at rest at Pi because if the arrow were moving during Ti there would be a further sequence Til of time instants required for the arrow to traverse the smaller distance Now regardless of the level to which this recursive argument is applied one is left with the flight of the arrow comprising a sequence of positions at which the arrow is at rest The original intent of presenting this paradox has been interpreted to be as an argument against the possibility of individuated objects moving in space

Artificial Intelligence Margaret A. Boden,1996-06-20 Artificial Intelligence is the study of how to build or program computers to enable them to do what minds can do This volume discusses the ways in which computational ideas and computer modeling can aid our understanding of human and animal minds Major theoretical approaches are outlined as well as some promising recent developments Fundamental philosophical questions are discussed along with topics such as the differences between symbolic and connectionist AI planning and problem solving knowledge representation learning expert systems vision natural language creativity and human computer interaction This volume is suitable for any psychologist philosopher or computer scientist wanting to know the current state of the art in this area of cognitive science Up to date
