Introduces Charles Darwin's research, findings, and theories.

- Define evolution.
- Describe the significance of the voyage of the *HMS Beagle*.
- Summarize Darwin's finding on the Galápagos Islands.

Where in the world is this?

This picture was taken in the Galápagos Islands, which is off the west coast of South America. The Galápagos Islands are home to many unique organisms, such as these tree-like cacti. Darwin's observations on these islands led to his development of the theory of evolution.

## Darwin's Theory of Evolution

Do you ever wonder why some **birds** are big like ostriches and some birds are small like robins? Or why a lion has a mane while a leopard has spots? In the 19th century, an English natural scientist named Charles Darwin (Figure **below**) was also fascinated by the diversity of life on Earth.

He set out to answer the following questions:

- Why are organisms different?
- Why are organisms similar?
- Why are there so many different types of organisms?

To answer his questions, he developed what we now call "the theory of evolution by **natural selection**." This theory is one of the most important theories in the field of life science. In everyday English, "evolution" simply means "change." In biology, evolution states that all living organisms came from earlier forms of life. The theory of evolution by **natural selection** explains why evolution occurs. Darwin spent over 20 years traveling around the world and making

*The Theory of Evolution* John Maynard Smith, 1993-07-30 A century ago Darwin and Wallace explained how evolution could have happened in terms of processes known to take place today This book describes how their theory has been confirmed but at the same time transformed by recent research

*The Theory of Evolution* Cynthia Mills, 2004-04-22 Taking a historical approach Mills begins with Enlightenment era explanations for the origins of life introducing the early scientists and philosophers who had the greatest influence on Darwin's thinking She then examines Darwin's seminal work and later elaborations Jacket

**The Theory of Evolution** Samuel M. Scheiner, David P. Mindell, 2020-01-07 Darwin's nineteenth century writings laid the foundations for modern studies of evolution and theoretical developments in the mid twentieth century fostered the Modern Synthesis Since that time a great deal of new biological knowledge has been generated including details of the genetic code lateral gene transfer and developmental constraints Our improved understanding of these and many other phenomena have been working their way into evolutionary theory changing it and improving its correspondence with evolution in nature And while the study of evolution is thriving both as a basic science to understand the world and in its applications in agriculture medicine and public health the broad scope of evolution operating across genes whole organisms clades and ecosystems presents a significant challenge for researchers seeking to integrate abundant new data and content into a general theory of evolution This book gives us that framework and synthesis for the twenty first century The Theory of Evolution presents a series of chapters by experts seeking this integration by addressing the current state of affairs across numerous fields within evolutionary biology ranging from biogeography to multilevel selection speciation and macroevolutionary theory By presenting current syntheses of evolution's theoretical foundations and their growth in light of new datasets and analyses this collection will enhance future research and understanding

Flannery, Alfred Russel Wallace, 2020-08-12 Alfred Russel Wallace 1823 1913 co discoverer of natural

selection was second only to Charles Darwin as the 19th century's most noted English naturalist. Yet his belief in spiritualism caused him to be ridiculed and dismissed by many, leaving him a comparatively obscure and misunderstood figure. In this volume, Wallace is finally allowed to speak in his own defense through his grand evolutionary synthesis, *The World of Life*, published over a century ago in 1910. More than just a reprinting of a near-forgotten work, Michael A. Flannery places Wallace in historical context and includes the very latest historiography relating to both Darwin and Wallace in his detailed introduction. Flannery exposes Charles Darwin's now-famous theory of evolution as little more than a naturalistic cover for an extreme philosophical materialism borrowed as a youth from Edinburgh radicals. This is juxtaposed by his sympathetic account of what he calls Wallace's intelligent evolution, a thoroughly teleological alternative to Darwin's stochastic processes. Though based upon very different formulations of natural selection, the Wallace-Darwin dispute as presented by Flannery shows a metaphysical clash of worldviews coextensive with modern evolutionary theory itself: design and purpose versus randomness and chance. This book is for anyone seeking to understand the historical and philosophical roots of a controversy that still rages today. This book contains an abridgement of Alfred Russel Wallace's *The World of Life* and Reverend John Mages Mello's essay *The Mystery of Life and Mind*. Michael A. Flannery is Professor Emeritus, UAB Libraries, University of Alabama at Birmingham. Professor Flannery has published extensively in medical history and bioethics, winning the prestigious Edward Kremers Award in 2001 for distinguished writing by an American from the American Institute of the History of Pharmacy, the Murray Gottlieb Prize in history by the Medical Library Association in 2002, and the 2006 Publishers Award of the Archivists and Librarians in the History of Health Sciences. This is his tenth book. *The Structure of Evolutionary Theory*, Stephen Jay Gould, 2002-03-21. The world's most revered and eloquent interpreter of evolutionary ideas offers here a work of explanatory force unprecedented in our time, a landmark publication both for its historical sweep and for its scientific vision. With characteristic attention to detail, Stephen Jay Gould first describes the content and discusses the history and origins of the three core commitments of classical Darwinism: that natural selection works on organisms, not genes or species; that it is almost exclusively the mechanism of adaptive evolutionary change; and that these changes are incremental, not drastic. Next, he examines the three critiques that currently challenge this classic Darwinian edifice: that selection operates on multiple levels, from the gene to the group; that evolution proceeds by a variety of mechanisms, not just natural selection; and that causes operating at broader scales, including catastrophes, have figured prominently in the course of evolution. Then, in a stunning tour de force that will likely stimulate discussion and debate for decades, Gould proposes his own system for integrating these classical commitments and contemporary critiques into a new structure of evolutionary thought. In 2001, the Library of Congress named Stephen Jay Gould one of America's eighty-three Living Legends, people who embody the quintessentially American ideal of individual creativity, conviction, dedication, and exuberance. Each of these qualities finds full expression in this peerless work, the likes of which the scientific world has not seen and may not see again.
