UML for Real Luciano Lavagno, Grant Martin, Bran V. Selic, 2007-05-08 The complexity of most real time and embedded systems often exceeds that of other types of systems since in addition to the usual spectrum of problems inherent in software they need to deal with the complexities of the physical world That world as the proverbial Mr Murphy tells us is an unpredictable and often unfriendly place Consequently there is a very strong motivation to investigate and apply advanced design methods and technologies that could simplify and improve the reliability of real time software design and implementation As a result from the first versions of UML issued in the mid 1990 s designers of embedded and real time systems have taken to UML with vigour and enthusiasm However the dream of a complete model driven design flow from specification through automated optimised code generation has been difficult to realise without some key improvements in UML semantics and syntax specifically targeted to the real time systems problem With the enhancements in UML that have been proposed and are near standardisation with UML 2 0 many of these improvements have been made In the Spring of 2003 adoption of a formalised UML 2 0 specification by the members of the Object Management Group OMG seems very close It is therefore very appropriate to review the status of UML as a set of notations for embedded real time systems both the state of the art and best practices achieved up to this time with UML of previous generations and where the changes embodied in the 2

Farming the Cutover

Robert J. Gough, 1997 *Farming the Cutover* describes the visions and accomplishments of these settlers from their perspective. People of the cutover managed to forge lives relatively independent of market pressures and for this they were characterized as backward by outsiders and their part of the state was seen as a hideout for organized crime figures. State and federal planners, county agents, and agriculture professors eventually determined that the cutover could be engineered by professional and academic expertise into a Progressive social model and the lives of its inhabitants improved. By 1940 they had begun to implement public policies that discouraged farming and they eventually decided that the region should be depopulated and the forests replanted. By exploring the history of an eighteen county region, Robert Gough illustrates the travails of farming in marginal areas. He juxtaposes the social history of the farmers with the opinions and programs of the experts who sought to improve the region. Significantly, what occurred in the Wisconsin cutover anticipated the sweeping changes that transformed American agriculture after World War II. **Embedded Systems Programming**, 1998-07

Contributors from industry, government, and academia swap ideas, techniques, and applications of computer simulations in the 20 papers, among which are not the keynote and the other invited talk. They consider such aspects as an efficient asynchronous simulation technique for high speed slotted networks, a simulation based performance analysis of a gang scheduling in a distributed system, a framework for simulating heterogeneous virtual processors, assessing the safety of hardware software systems using fault simulation, evaluating the performance of a parallel simulation environment, genetic simulation for finite state machine identification, and hardware support for generating a floating point map function.
