Web Studies:

Internet Studies Dr Panayiota Tsatsou, 2014-10-28 A comprehensive overview of the field Internet Studies considers key issues of social importance that the study of the Internet draws upon At the same time it examines the role of the Internet in social research and the development of highly interdisciplinary and rapidly developing Internet research Hence this volume maps out areas of certainty and uncertainty in the study of the Internet and as such it will be of interest to scholars and students of media and communication sociology and social research methods **The Oxford Handbook of Internet**

Studies William H. Dutton, 2013-01-10 Internet Studies has been one of the most dynamic and rapidly expanding interdisciplinary fields to emerge over the last decade The Oxford Handbook of Internet Studies has been designed to provide a valuable resource for academics and students in this area bringing together leading scholarly perspectives on how the Internet has been studied and how the research agenda should be pursued in the future The Handbook aims to focus on Internet Studies as an emerging field each chapter seeking to provide a synthesis and critical assessment of the research in a particular area Topics covered include social perspectives on the technology of the Internet its role in everyday life and work implications for communication power and influence and the governance and regulation of the Internet The Handbook is a landmark in this new interdisciplinary field not only helping to strengthen research on the key questions but also shape research policy and practice across many disciplines that are finding the Internet and its political economic cultural and other societal implications increasingly central to their own key areas of inquiry **International Handbook of Internet**

Research Jeremy Hunsinger, Lisbeth Klastrup, Matthew Allen, 2010-06-17 Internet research spans many disciplines From the computer or information sciences through engineering and to social sciences humanities and the arts almost all of our disciplines have made contributions to internet research whether in the effort to understand the effect of the internet on their area of study or to investigate the social and political changes related to the internet or to design and develop software and hardware for the network The possibility and extent of contributions of internet research vary across disciplines as do the purposes methods and outcomes Even the epistemological underpinnings differ widely The internet then does not have a discipline of study for itself It is a field for research Baym 2005 an open environment that simultaneously supports many approaches and techniques not otherwise commensurable with each other There are of course some inhibitions that limit explorations in this field research ethics disciplinary conventions local and national norms customs laws borders and so on Yet these limits on the internet as a field for research have not prevented the rapid expansion and exploration of the internet After nearly two decades of research and scholarship the limits are a positive contribution providing bases for discussion and interrogation of the contexts of our research making internet research better for all These limits challenges that constrain the theoretically limitless space for internet research create boundaries that give definition to the field and provide us with a particular topography that enables research and investigation **Food Webs and Biodiversity** Axel G. Rossberg, 2013-06-03

Food webs have now been addressed in empirical and theoretical research for more than 50 years. Yet even elementary foundational issues are still hotly debated. One difficulty is that a multitude of processes need to be taken into account to understand the patterns found empirically in the structure of food webs and communities. *Food Webs and Biodiversity* develops a fresh comprehensive perspective on food webs. Mechanistic explanations for several known macroecological patterns are derived from a few fundamental concepts which are quantitatively linked to field observables. An argument is developed that food webs will often be the key to understanding patterns of biodiversity at community level. Key Features: Predicts generic characteristics of ecological communities in invasion extirpation equilibrium. Generalizes the theory of competition to food webs with arbitrary topologies. Presents a new testable quantitative theory for the mechanisms determining species richness in food webs and other new results. Written by an internationally respected expert in the field. With global warming and other pressures on ecosystems rising, understanding and protecting biodiversity is a cause of international concern. This highly topical book will be of interest to a wide ranging audience including not only graduate students and practitioners in community and conservation ecology but also the complex systems research community as well as mathematicians and physicists interested in the theory of networks. This is a comprehensive work outlining a large array of very novel and potentially game changing ideas in food web ecology. Ken Haste Andersen, Technical University of Denmark. I believe that this will be a landmark book in community ecology; it presents a well established and consistent mathematical theory of food webs. It is testable in many ways and the author finds remarkable agreements between predictions and reality.

At its heart it might be described as a formalized approach toward problem solving, thinking and acquiring knowledge, the success of which depends upon clearly defined objectives and appropriate choice of statistical tools, tests and analysis to meet a project's objectives. Comprising more than 500 entries, the *Encyclopedia of Research Design* explains how to make decisions about research design, undertake research projects in an ethical manner, interpret and draw valid inferences from data, and evaluate experiment design strategies and results. Two additional features carry this encyclopedia far above other works in the field: bibliographic entries devoted to significant

articles in the history of research design and reviews of contemporary tools such as software and statistical procedures used to analyze results

Key Features Covers the spectrum of research design strategies from material presented in introductory classes to topics necessary in graduate research Addresses cross and multidisciplinary research needs with many examples drawn from the social and behavioral sciences neurosciences and biomedical and life sciences Provides summaries of advantages and disadvantages of often used strategies Uses hundreds of sample tables figures and equations based on real life cases

are wholly or partly online e.g social networks news political communication and social scientists with offline research topics with an online reflection even if this is not a core component e.g diaspora communities consumer culture linguistic change The book is also intended for library and information science students in the belief that the knowledge and techniques described will be useful for them to guide and aid other social scientists in their research In addition the techniques and issues are all directly relevant to library and information science research problems Table of Contents Introduction Web Impact Assessment Link Analysis Blog Searching Automatic Search Engine Searches LexiURL Searcher Web Crawling SocSciBot Search Engines and Data Reliability Tracking User Actions Online Advanced Techniques Summary and Future Directions
