Topics In Fluorescence Spectroscopy Vol 2 Principles:

Topics in Fluorescence Spectroscopy Joseph R. Lakowicz, 2006-04-18 Fluorescence spectroscopy and its applications to the physical and life sciences have evolved rapidly during the past decade. The increased interest in fluorescence appears to be due to advances in time resolution methods of data analysis and improved instrumentation. With these advances it is now practical to perform time resolved measurements with enough resolution to compare the results with the structural and dynamic features of macromolecules to probe the structures of proteins, membranes and nucleic acids and to acquire two dimensional microscopic images of chemical or protein distributions in cell cultures. Advances in laser and detector technology have also resulted in renewed interest in fluorescence for clinical and analytical chemistry. Because of these numerous developments and the rapid appearance of new methods it has become difficult to remain current on the science of fluorescence and its many applications. Consequently I have asked the experts in particular areas of fluorescence to summarize their knowledge and the current state of the art. This has resulted in the initial two volumes of Topics in Fluorescence Spectroscopy which is intended to be an ongoing series which summarizes in one location the vast literature on fluorescence spectroscopy. The third volume will appear shortly. The first three volumes are designed to serve as an advanced text. These volumes describe the more recent techniques and technologies. Volume 1 the principles governing fluorescence and the experimental observables. Volume 2 and applications in biochemistry and biophysics. Volume 3

Spectrophotometry and Spectrofluorimetry Mike Gore, 2000-05-04 Spectrophotometry and Spectrofluorimetry A Practical Approach Second Edition was written with the intention to help the reader understand the background concepts and practical applications of spectrophotometry and spectrofluorimetry. Optical spectroscopy underpins the day to day operations of most laboratories in the chemical, biological and medical sciences and this edition contains substantially updated and new chapters addressing the principles of most of the more common applications such as spectrophotometry, spectrophotometric assays, spectrofluorimetry, time resolved fluorescence and phosphorescence studies, circular dichroism and pre-equilibrium spectroscopic techniques. In all chapters the emphasis is placed upon the practical aspects with protocols to guide readers through test experiments. Other chapters are included to introduce subjects that have traditionally depended upon spectroscopy such as basic enzyme kinetics, ligand binding data handling and the more recently established interest in the study of protein and DNA stability. Finally the concept of global analysis is introduced to provide the reader with an insight into this method of utilizing the vast arrays of experimental data provided by current instrumentation.
