Ancient and Modern Theories of Visual Perception Willem van Hoorn,1972 *On Seeing Forms* William R. Uttal,2014-06-27 Originally published in 1988 this is the final volume in the set The original intent of the tetralogy was to review neural explanations of high level perceptual and cognitive processes However at this point it became clear that there were few neural explanations of perceptual topics a situation that still persists today This book therefore used a different framework examining the role of detection discrimination and recognition at the behavioral level <u>Visual Perception</u> Lothar Spillmann,John S. Werner,2012-12-02 This book presents an interdisciplinary overview of the main facts and theories that guide contemporary research on visual perception While the chapters cover virtually all areas of visual science from philosophical foundations to computational algorithms and from photoreceptor processes to neuronal networks no attempt has been made to provide an exhaustive treatment of these topics Rather researchers from such diverse disciplines as psychology neurophysiology anatomy and clinical vision sciences have worked together to review some of the most important correlations between perceptual phenomena and the underlying neurophysiological processes and mechanisms The book is thus intended to serve as an advanced text for graduate students and as a guide for all vision researchers to understanding current progress outside their specialized fields of interest Examines parallel processing of visual information Discusses links between physiologically measured receptive fields and psychophysically measured perceptive fields Presents a spatial sampling by the retina and cortical modules Covers signal transduction and the sites of adaptation Describes a single cell analysis of attention Discusses computational models of vision *Perception and Cognition* Gary Carl Hatfield,2009 How do we see This question has fascinated and perplexed philosophers and scientists for millennia In visual perception mind and world meet when light reflected from objects enters the eyes and stimulates the nerves leading to activity in the brain near the back of the head This neural activity yields conscious experiences of a world in three dimensions clothed in colors and immediately recognized as say ground sky grass trees and friends The visual brain also produces nonconscious representations that interact with other brain systems for perception and cognition and that help to regulate our visually guided actions But how does all of this really work The answers concern the physiology psychology and philosophy of visual perception and cognition Gary Hatfield s essays address fundamental questions concerning in Part I the psychological processes underlying spatial perception and perception of objects in Part II psychological theories and metaphysical controversies about color perception and qualia and in Part III the history and philosophy of theories of vision including methodological controversies surrounding introspection and involving the relations between psychology and the fields of neuroscience and cognitive science An introductory chapter provides a unified overview an extensive reference list rounds out the volume *Perception Beyond Gestalt* Adam Geremek,Mark Greenlee,Svein Magnussen,2013-09-11 How does the brain piece together the information required to achieve object recognition figure ground segmentation object completion in cases of partial occlusion and related perceptual phenomena This book focuses on principles of Gestalt psychology and the

key issues which surround them providing an up to date survey of the most interesting and highly debated topics in visual neuroscience perception and object recognition The volume is divided into three main parts Gestalt and perceptual organisation attention aftereffects and illusions and color vision and art perception Themes covered in the book include a historical review of Gestalt theory and its relevance in modern day neuroscience the relationship between perceptive and receptive fields a critical analysis of spatiotemporal unity of perception the role of Gestalt principles in perceptual organization self organizing properties of the visual field the role of attention and perceptual grouping in forming non retinotopic representations figural distortions following adaptation to spatial patterns illusory changes of brightness in spatial patterns the function of motion illusions as a tool to study Gestalt principles in vision conflicting theories of color vision and the neural basis of it the role of color in figure ground segmentation chromatic assimilation in visual art and perception the phenomena of colored shadows Including contributions from experts in the field this book will provide an essential overview of current research and theory on visual perception and Gestalt It will be key reading for researchers and academics in the field of visual perception and neuroscience   **Theory of Perception** George Pitcher,2015-03-08 Presented here in a lucid simple style is an extended defense of a behavioral and direct realist theory of sense perception Originally published in 1971 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905   **An Essay Towards a New Theory of Vision** George Berkeley,2022-06-02 In An Essay Towards a New Theory of Vision George Berkeley presents a groundbreaking exploration of visual perception that challenges the prevailing Cartesian views of his time Through meticulous argumentation and innovative thought Berkeley posits that visual experience is not merely a passive reception of light but is actively shaped by the mind s inherent structures He intricately examines the relationship between sight and distance using reflections on empirical observation and philosophical inquiry to argue that what is seen is inextricably linked to the observer s prior sensory experiences This work not only anticipates later developments in the philosophy of perception but also engages with the empirical methodologies emerging in the early 18th century thus cementing Berkeley s legacy in both philosophy and optics George Berkeley an Irish philosopher and a leading figure of the empiricist movement was profoundly influenced by the works of John Locke and the emergent scientific discourse of his era His unique focus on the subjective nature of reality and his rejection of materialism stem from his theological commitments and fervent belief in the primacy of perception Berkeley s wider philosophical pursuits intersecting metaphysics and epistemology provide a rich backdrop for his insights on vision reflecting his desire to reconcile sensory experience with philosophical rigor This compelling treatise is a must read

for scholars and enthusiasts of philosophy optics and cognitive science Berkeley s innovative approach invites readers to reconsider their understanding of vision s role in shaping experience and knowledge By delving into Berkeley s arguments readers will gain not only philosophical insights but also a profound appreciation for the complexities of human perception making this work a seminal contribution to the fields of both philosophy and the natural sciences   <u>Visual Perception</u> Terry Caelli,1981   *Ancient and Modern Theories of Visual Perception* Willibrordus Carolus Laurentius van Hoorn,1972

   Seeing Things as They are John R. Searle,2015 This book provides a comprehensive account of the intentionality of perceptual experience With special emphasis on vision Searle explains how the raw phenomenology of perception sets the content and the conditions of satisfaction of experience The central question concerns the relation between the subjective conscious perceptual field and the objective perceptual field Everything in the objective field is either perceived or can be perceived Nothing in the subjective field is perceived nor can be perceived precisely because the events in the subjective field consist of the perceivings whether veridical or not of the events in the objective field Searle begins by criticizing the classical theories of perception and identifies a single fallacy what he calls the Bad Argument as the source of nearly all of the confusions in the history of the philosophy of perception He next justifies the claim that perceptual experiences have presentational intentionality and shows how this justifies the direct realism of his account In the central theoretical chapters he shows how it is possible that the raw phenomenology must necessarily determine certain form of intentionality Searle introduces in detail the distinction between different levels of perception from the basic level to the higher levels and shows the internal relation between the features of the experience and the states of affairs presented by the experience The account applies not just to language possessing human beings but to infants and conscious animals He also discusses how the account relates to certain traditional puzzles about spectrum inversion color and size constancy and the brain in the vat thought experiments In the final chapters he explains and refutes Disjunctivist theories of perception explains the role of unconscious perception and concludes by discussing traditional problems of perception such as skepticism
