Wireless Network Coexistence:

WIRELESS NETWORK COEXISTENCE Robert Morrow, 2004-01-22 This is the only book that addresses the integration of Bluetooth and 802.11 technologies showing how to deploy both technologies to create profitable and flexible wireless solutions. The author compares and contrasts Bluetooth and 802.11 functionality using the results to determine which part each should play in a fully integrated wireless LAN environment. Illustrates how implementing combined wireless solutions can save money and increase performance. Provides decision makers with the tools they need to make better informed choices about wireless technologies. Given the hype surrounding Bluetooth and 802.11 it's difficult to get a practical understanding of what the two services offer. For a complete and efficient wireless LAN solution both technologies must be integrated.

Wireless Coexistence Daniel Chew, Andrew L. Adams, Jason Uher, 2021-09-15 Wireless Coexistence: Explore a comprehensive review of the motivation for wireless coexistence and the standards and technology used to achieve it. Wireless Coexistence: Standards, Challenges, and Intelligent Solutions delivers a thorough exploration of wireless ecosystems sharing the spectrum, including the multiple standards and key requirements driving the current state of wireless technology. The book surveys several standards including IEEE 802.22, 802.15.2, and 802.19.1 and expands upon recent advances in machine learning and artificial intelligence to demonstrate how these technologies might be used to meet or exceed the challenges of wireless coexistence. The text discusses cognitive radio in the context of spectrum coexistence and provides a comparison and assessment of using artificial intelligence in place of or in addition to current techniques. It also considers applications to communication theory, learning algorithms for passive wireless coexistence strategies, spectrum situational awareness, and active wireless coexistence strategies. With the necessity of spectrum sharing and the scarcity of unused spectrum on the rise, the standardization of wireless coexistence becomes more important with each passing day. Readers will learn about the challenges posed by shrinking wireless real estate and from the inclusion of topics like a thorough introduction to the concept of and motivation for wireless coexistence, including congestion and interference policies and regulations. An exploration of different wireless coexistence standards, including the need for standardization and various protocols including 802.22, 802.15.2, 802.19.1, P1900, and 3GPP Release 13/14 LAA. A discussion of the applications of communication theory, including primary user strategies, primary multi-user protocols, and successive interference cancellation. A treatment of concepts in learning algorithms. Perfect for scientists, researchers, engineers, developers, educators, and administrators working in the area of wireless networks. Wireless Coexistence: Standards, Challenges, and Intelligent Solutions will also earn a place in the libraries of graduate students studying wireless networks and seeking a one-stop reference for subjects related to wireless coexistence standards.

Cross-Technology Coexistence Design for Wireless Networks Junmei Yao, Kaishun Wu, 2023-05-22 This book introduces readers to the fundamentals of the cross-technology coexistence problem in heterogeneous wireless networks. It also highlights a range of mechanisms designed to combat this

problem and improve network performance including protocol design theoretical analysis and experimental evaluation In turn the book proposes three mechanisms that can be combined to combat the cross technology coexistence problem and improve network performance First the authors present a fast signal identification method It provides the basis for the subsequent protocol design and allows heterogeneous devices to adopt proper transmission strategies Second the authors present two cross technology interference management mechanisms in both the time domain and the frequency domain which can mitigate interference and increase transmission opportunities for heterogeneous devices thus improving network performance Third they present a cross technology communication mechanism based on symbol level energy modulation which allows heterogeneous devices to transmit information directly without a gateway improving transmission efficiency and paving the way for new applications in IoT scenarios Lastly they outline several potential research directions to further improve the efficiency of cross technology coexistence This book is intended for researchers computer scientists and engineers who are interested in the research areas of wireless networking wireless communication mobile computing and Internet of Things Advanced level students studying these topics will benefit from the book as well

Coexistence in Wireless Networks Nada Golmie,2006-09-14 The increasing popularity of wireless networks makes interference and cross talk between multiple systems inevitable This book describes techniques for quantifying this and the effects on the performance of wireless networks operating in the unlicensed bands It also presents a variety of system level solutions obviating the need for new hardware implementations The book starts with basic concepts and wireless protocols before moving on to interference performance evaluation interference modeling coexistence solutions and concluding with common misconceptions and pitfalls The theory is illustrated by reference to real world systems such as Bluetooth and WiFi With a number of case studies and many illustrations this book will be of interest to graduate students in electrical engineering and computer science to practitioners designing new WLAN and WPAN systems or developing new techniques for interference suppression and to general users of merging wireless technologies

Models and Algorithms for Spectrum Coexistence in Wireless Networks Shweta S. Sagari,2016 In the last decade there have been several technological trends that have occurred together and have caused a shift in how wireless systems will be deployed The significant increase in the capabilities of mobile devices combined with the proliferation of Internet enabled services and the improvement in the communication support provided by new waveforms for wireless communications have initiated a shift from the traditional macrocell based cellular network to new forms of radio access technologies RATs involving multiple smaller cells deployed in vicinity of each other These small cells will often support diverse wireless technologies and be operated by different providers The resulting heterogeneity unfortunately can lead to serious internetwork interference that can negate the improvement in overall system performance that was the original

motivation for employing many small cells in close proximity In this thesis we examine different technologies that are needed for flexible spectrum management to support the coordination that is needed for coexistence between many small cell wireless networks Motivated by the need for internetwork architectures that support spectrum coordination we 1 conduct performance evaluation associated with the joint deployment of mobile and fixed hotspot networks 2 develop spectrum models that characterize interference among different wireless entities 3 provide new methods for efficient hardware emulation of wireless channels 4 devise algorithms that estimate radio spectrum usage and 5 provide algorithms for coordination between different wireless systems to improve the overall system performance and spectrum efficiency The first part of the thesis investigates spectrum coexistence in wireless networks by exploring the underlying performance challenges that exist when mobile hotspots are deployed in an environment of densely deployed static wireless access networks Next part of thesis investigates design of hardware emulator of radio channels to accurately capture the effect of real world wireless channels upon communications waveforms while minimizing computational complexity Next we explore a fundamental building block of spectrum management for supporting better utilization of radio spectrum which involves predicting the impact that an emitter will have at different geographic locations We then examine various challenges associated with coordinating spectrum access between different wireless technologies by exploring the specific case of Wi Fi and LTE coexistence in emerging unlicensed frequency bands Finally recognizing the broad challenges associated with addressing spectrum coexistence in emerging wireless systems we identify several directions for future investigation and suggest different approaches for tackling these challenges

Architectures and Mechanisms for Wireless Coexistence Steven Siying Hong, 2012 Wireless has quickly become an irreplaceable medium for communication but by their very nature wireless transmissions are vulnerable to RF interference from various sources This weakness is a growing problem for technologies that operate in unlicensed frequency bands as these bands are becoming more crowded over time The increasing density of radios coupled with the growing number of different protocols dictates that future wireless devices will require the ability to coexist and operate in a crowded and often unregulated electromagnetic environment This dissertation presents a set of architectures and mechanisms for wireless coexistence These mechanisms are intended as general primitives enabling future wireless networks to be architected such that they are aware of who their RF neighbors are what they are doing and how to respond to them We design and develop two systems each demonstrating how changes at different levels across the network stack can provide significant gains Degrees Of Freedom DOF is a robust and accurate technique to detect activity in any band of the relevant spectrum while Picasso is an extensible radio design which allows the device to more easily exploit the fragmented bands which are available This dissertation contributes to advancing the state of the art in wireless network design in multiple ways First the systems in this dissertation present novel algorithms that span signal processing circuit design and software systems Not only do these algorithms enrich existing theory they are designed with practical implementations in mind helping to bridge the gap

between theory and practice Second we present prototype implementations and testbed evaluations of our systems Our results demonstrate that our systems deliver significantly improved performance in crowded interferencecentric environments compared to the state of the art Finally the work in this dissertation demonstrates that by having layers work cooperatively rather than in isolation common goals of high throughput and reliability in dense interference scenarios are much more practical to achieve In particular DOF demonstrates that more fine grained information passed between the PHY and the MAC enables the MAC to make more informed and intelligent decisions regarding how to respond to the varying sources of interference In the same vain Picasso demonstrates that increased RF isolation can significantly lessen the burden on PHY filtering and MAC coordination similarly allowing the three to share in the task of exploiting fragmented spectrum We believe that the systems in this dissertation make a compelling and strong argument for cross layer interdisciplinary wireless network design in order to solve the problems of wireless coexistence
