Conceptual Information Retrieval Michael L. Mauldin, 2012-12-06 The information revolution is upon us Whereas the industrial revolution heralded the systematic augmentation of human physical limitations by harnessing external energy sources the information revolution strives to augment human memory and mental processing limitations by harnessing external computational resources Computers can accumulate transmit and output much more information and in a more timely fashion than more conventional printed or spoken media Of greater interest however is the computer's ability to process classify and retrieve information selectively in response to the needs of each human user One cannot drink from the fire hydrant of information without being immediately flooded with irrelevant text Recent technological advances such as optical character readers only exacerbate the problem by increasing the volume of electronic text Just as steam and internal combustion engines brought powerful energy sources under control to yield useful work in the industrial revolution so must we build computational engines that control and apply the vast information sources that they may yield useful knowledge Information science is the study of systematic means to control classify process and retrieve vast amounts of information in electronic form In particular several methodologies have been developed to classify texts manually by armies of human indexers as illustrated quite clearly at the National Library of Medicine and many computational techniques have been developed to search textual data bases automatically such as full text keyword searches In general The Observer's Guide to Planetary Motion Dominic Ford, 2014-05-14 To the naked eye the most evident defining feature of the planets is their motion across the night sky It was this motion that allowed ancient civilizations to single them out as different from fixed stars The Observer's Guide to Planetary Motion takes each planet and its moons if it has them in turn and describes how the geometry of the Solar System gives rise to its observed motions Although the motions of the planets may be described as simple elliptical orbits around the Sun we have to observe them from a particular vantage point the Earth which spins daily on its axis and circles around the Sun each year The motions of the planets as observed relative to this spinning observatory take on more complicated patterns Periodically objects become prominent in the night sky for a few weeks or months while at other times they pass too close to the Sun to be observed The Observer's Guide to Planetary Motion provides accurate tables of the best time for observing each planet together with other notable events in their orbits helping amateur astronomers plan when and what to observe Uniquely each of the chapters includes extensive explanatory text relating the events listed to the physical geometry of the Solar System Along the way many questions are answered Why does Mars take over two years between apparitions the times when it is visible from Earth in the night sky while Uranus and Neptune take almost exactly a year Why do planets appear higher in the night sky when they're visible in the winter months Why do Saturn's rings appear to open and close every 15 years This book places seemingly disparate astronomical events into an understandable three dimensional structure enabling an appreciation that for example very good apparitions of Mars come

around roughly every 15 years and that those in 2018 and 2035 will be nearly as good as that seen in 2003 Events are listed for the time period 2010-2030 and in the case of rarer events such as eclipses and apparitions of Mars even longer time periods are covered A short closing chapter describes the seasonal appearance of deep sky objects which follow an annual cycle as a result of Earth's orbital motion around the Sun The Fact Book Francis Rolt-Wheeler, 1911 **Our Solar System**, **Cosmic Challenge** Philip S. Harrington, 2010-10-21 Listing more than 500 sky targets both near and far in 187 challenges this observing guide will test novice astronomers and advanced veterans alike Its unique mix of Solar System and deep sky targets will have observers hunting for the Apollo lunar landing sites searching for satellites orbiting the outermost planets and exploring hundreds of star clusters nebulae distant galaxies and quasars Each target object is accompanied by a rating indicating how difficult the object is to find an in depth visual description an illustration showing how the object realistically looks and a detailed finder chart to help you find each challenge quickly and effectively The guide introduces objects often overlooked in other observing guides and features targets visible in a variety of conditions from the inner city to the dark countryside Challenges are provided for the naked eye through binoculars and the largest backyard telescopes
