Lang, 2007-12-31 Written in a light and friendly style this lavishly illustrated book introduces the Sun and its physics and describes all aspects of the Sun's interaction with us on Earth The second edition of this book updates the popular text by providing comprehensive accounts of the most recent discoveries made by five modern solar spacecraft during the past decade It contains a number of images never before seen in print Breakthrough observations with the underground Sudbury Neutrino Observatory are also included The new edition further provides modern interpretations of ozone depletion and global warming

Sun-Earth Plasma Connections James L. Burch, Robert L. Carovillano, Spiro K. Antiochos, 1999-01-26 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 109 The Sun and the terrestrial magnetosphere have been the subjects of active research since the dawn of the space age The capabilities of observing both systems with greater and greater detail evolved separately until the 1980s when it was realized that definitive results on the connection between the Earth and the Sun would require a concerted and joint effort It was also realized that sophisticated solar terrestrial research communities existed within all the space-faring nations of the world and that no one of them could launch such an effort by itself This realization led to the creation of the International Solar Terrestrial Physics (ISTP) program which now comprises at least 12 spacecraft and includes extensive ground-based observations and theory and modeling efforts

The Sun, the Earth, and Near-Earth Space National Aeronautics and Space Administration, John A. Eddy, 2009-03-05 This colorful book provides concise explanations and descriptions easily read and readily understood of what is now known of the chain of events and processes that connect the Sun to the Earth with special emphasis on space weather and sun climate NP 2009 066 GSFC In a world of warmth and light and living things we soon forget that we are surrounded by a vast universe that is cold and dark and deadly dangerous just beyond our door On a starry night when we look out into the darkness that lies around us the view can be misleading in yet another way for the brightness and sheer number of stars and their chance groupings into familiar constellations make them seem much nearer to each other and to us than in truth they are And every one of them each twinkling like a diamond in the sky is a white hot sun much like our own The nearest stars in our own galaxy the Milky Way are more than a million times further away from us than our star the Sun We could make a telephone call to the Moon and expect to wait but a few seconds between pieces of a conversation or but a few hours in calling any planet in our solar system
