autonomous driving game playing molecular recombination and robotics In all these fields computer programs have taught themselves to understand problems that were previously considered to be very difficult In the game of Go the program AlphaGo has even learned to outmatch three of the world's leading players Deep reinforcement learning takes its inspiration from the fields of biology and psychology Biology has inspired the creation of artificial neural networks and deep learning while psychology studies how animals and humans learn and how subjects desired behavior can be reinforced with positive and negative stimuli When we see how reinforcement learning teaches a simulated robot to walk we are reminded of how children learn through playful exploration Techniques that are inspired by biology and psychology work amazingly well in computers animal behavior and the structure of the brain as new blueprints for science and engineering In fact computers truly seem to possess aspects of human behavior as such this field goes to the heart of the dream of artificial intelligence These research advances have not gone unnoticed by educators Many universities have begun offering courses on the subject of deep reinforcement learning The aim of this book is to provide an overview of the field at the proper level of detail for a graduate course in artificial intelligence It covers the complete field from the basic algorithms of Deep Q learning to advanced topics such as multi agent reinforcement learning and meta learning

Exploiting Environment

Configurability in Reinforcement Learning Alberto Maria Metelli,2022-12-15 In recent decades Reinforcement Learning RL has emerged as an effective approach to address complex control tasks In a Markov Decision Process MDP the framework typically used the environment is assumed to be a fixed entity that cannot be altered externally There are however several real world scenarios in which the environment can be modified to a limited extent This book Exploiting Environment Configurability in Reinforcement Learning aims to formalize and study diverse aspects of environment configuration In a traditional MDP the agent perceives the state of the environment and performs actions As a consequence the environment transitions to a new state and generates a reward signal The goal of the agent consists of learning a policy i.e a prescription of actions that maximize the long term reward Although environment configuration arises quite often in real applications the topic is very little explored in the literature The contributions in the book are theoretical algorithmic and experimental and can be broadly subdivided into three parts The first part introduces the novel formalism of Configurable Markov Decision Processes Conf MDPs to model the configuration opportunities offered by the environment The second part of the book focuses on the cooperative Conf MDP setting and investigates the problem of finding an agent policy and an environment configuration that jointly optimize the long term reward The third part addresses two specific applications of the Conf MDP framework policy space identification and control frequency adaptation The book will be of interest to all those using RL as part of their work
