ANIMAL CELLS

One of the key functions of a cell is to synthesise proteins for use inside the cell, to lead to cell multiplication and for secretion out of the cell for example, insulin.

- Proteins are synthesised on ribosomes attached to rough endoplasmic reticulum.
- The newly synthesised proteins are transported through the cisternae of the rough ER and packaged into vesicles.
- They are transported to the Golgi apparatus, where vesicles fuse with the surface of the Golgi apparatus and the proteins enter.
- It is here that the newly synthesised proteins are modified and then packaged into vesicles. Secretory vesicles will transport proteins that are to be released from the cell to the cell surface membrane.
- They will fuse with the membrane and release the protein by exocytosis.

Q:

1. State two functions of the Golgi apparatus.
2. Draw from memory a labelled diagram of an animal cell.
3. Outline the functions of each cell component.

 <p>Nucleus the organelle that contains the cell's DNA and is the control center of the cell</p>	 <p>Chloroplast the organelle that uses the energy of sunlight to make food</p>
 <p>Ribosome the organelle in which amino acids are hooked together to make proteins</p>	 <p>Golgi complex the organelle that processes and transports proteins and other materials out of cell</p>
 <p>Endoplasmic reticulum the organelle that makes lipids, breaks down drugs and other substances, and packages proteins for Golgi complex</p>	 <p>Large central vacuole the organelle that stores water and other materials</p>
 <p>Mitochondrion the organelle that breaks down food molecules to make ATP</p>	 <p>Lysosome the organelle that digests food particles, wastes, cell parts, and foreign invaders</p>

top tip

Make sure you can draw the structure of a cell separately from its function.
