## **The Deepest Water:**

*The Oceanic Particle Flux and its Cycling Within the Deep Water Column* Maureen H. Conte, Rut Pedrosa Pàmies, Makio Honda, Gerhard Josef Herndl, 2022-10-20      **Deep Convection and Deep Water Formation in the Oceans** Simon Chu, J.C. Gascard, 1991-09-17 This book contains articles presenting current knowledge about the formation and renewal of deep waters in the ocean. These articles were presented at an international workshop at the Naval Postgraduate School in Monterey in March 1990. It is the first book entirely devoted to the topic of deep water formation in which articles have been both selected and reviewed and it is also the first time authors have addressed both surface and deep mixed layers. Highlighted are past and recent observations, description and analysis, concepts and models, and modern techniques for future research. Thanks to spectacular advances realised in computing sciences over the last twenty years, this volume includes a number of sophisticated numerical models. Observational as well as theoretical studies are presented and a clear distinction is established between open ocean deep convection and shelf processes, both leading to deep and bottom water formation. The main subject addressed is the physical mechanism by which the deep water in the ocean can be renewed. Ventilation occurs at the surface in areas called the gyres where water is mixed and oxygenated before sinking and spreading in the abyss of the deep ocean. This phenomenon is a very active area for both experimentalists and theoreticians because of its strong implications for the understanding of the world ocean circulation and Earth climate. This major theme sheds light on specific and complex processes happening in very restricted areas still controlling three quarters of the total volume of the ocean. All articles include illustrations and a bibliography. This book will be of particular interest to physical oceanographers, earth scientists, environmentalists, and climatologists.

*Atlas of the Deep-Water Seabed* Boris Dorschel, Andrew J. Wheeler, Xavier Montey, Koen Verbruggen, 2010-09-17 Presented in an accessible user friendly format, this atlas sets out all the major features revealed during one of the largest ever deep sea mapping campaigns. A unique insight into the morphology of the seabed along the continental margin of the North East Atlantic, it reveals for the first time many features that have hitherto been hidden beneath the waves. It is organised both thematically and by region, with the sea floor and its biological hotspots, areas of high biodiversity such as seamounts shown at a resolution not possible before. The atlas presents everything from submarine canyons to coral carbonate mounds, using digital terrain models generated from multibeam data and photographs taken from unmanned deep water vehicles (ROVs). The full colour imagery includes digital three dimensional seabed maps as well as the photographs with concise text descriptions and topic boxes used to highlight and explain the geological, biological, and hydrographical features in addition to their importance and context in the deep sea realm. Alongside the wealth of background information and topic boxes on special highlights, extensive online resources link the reader to full data sets and GIS locations, while suggestions for further reading point to ongoing research highlights. This is a fascinating resource that will be of use to anyone involved in off shore and underwater activities, whether scientific or commercial.      [Annual Report of](#)
