Tropical Climate Zones

Climate

Climate describes the average weather patterns in one area over a long period of time. These patterns include temperature, precipitation and wind. Different parts of the world have different climates. The type of climate depends mostly on the angle of the Earth to the Sun, which affects the Sun's rays hit Earth more directly and to how water circulates. It also depends on topography and how close the area is to an ocean. Some countries have a vast range of climates due to their size and land features.

Tropical climate

Tropical climates are close to the equator. They have high temperatures and high levels of rainfall. There are usually two main seasons in a tropical area: wet and dry. During the wet season, there are increased levels of rainfall. Areas near other tropical areas are drier than others and may have longer dry seasons.

Tropical zones

Tropical climate zones are roughly around the middle of the planet, following the equator. They include parts of Africa, Asia, Australia, North America and South America. Tropical climate is warmer than equatorial climate. The equator and surrounding areas are where the Sun's rays hit the Earth most directly for most of the year. This means that these areas generally have the most sunshine and highest temperatures on the planet. Many tropical areas are home to rich areas of tropical rainforests.
