Abstract

Boolean networks are a general model of interacting entities, with applications to biological phenomena such as gene regulation. Attractors play a central role, and the schedule of entities update is *a priori* unknown. This article presents results on the computational complexity of problems related to the existence of update schedules such that some limit-cycle lengths are possible or not. We first prove that given a Boolean network updated in parallel, knowing whether it has at least one limit-cycle of length k is **NP**-complete. Adding an existential quantification on the block-sequential update schedule does not change the complexity class of the problem, but the following alternation brings us one level above in the polynomial hierarchy: given a Boolean network, knowing whether there exists a block-sequential update schedule such that it has no limit-cycle of length k is **NP^{NP}**-complete.

1 Introduction

Boolean networks (BNs) were introduced by McCulloch and Pitts in the 1940s through the well known formal neural networks [17] that are specific BNs governed by a multi-dimensional threshold function. Informally, BNs are finite dynamical systems in which entities having Boolean states may interact with each other over discrete time. After their introduction, neural networks were studied in depth from the mathematical standpoint. Among the main works on them are the introduction by Kleene of finite automata and regular expression [16], first results on the dynamical behaviors of linear feedback shift register [13] and linear networks [8]. These researches led Kauffman and Thomas (independently) from the end of the 1960s to develop the use of BNs in the context of biological networks modeling [15, 27], which has paved the way to numerous applied works at the interface between molecular biology, computer science and discrete mathematics. In parallel, theoretical developments were done in the framework of linear algebra and numerical analysis by Robert [24], and in that of dynamical system theory and computational models, which constitutes the lens through which we look at BNs in this paper.

In this context, numerous studies have already been led and have brought very important results. Considering that a BN can be defined as a collection of local Boolean

Size-time Complexity of Boolean Networks for Prefix Computation Cornell University. Department of Computer Science, G. Bilardi, F. P. Preparata, 1987 The prefix problem consists of computing all the products $x_0 x_1 \dots x_{j-1}$ for $j = 0, 1, \dots, N-1$ given a sequence $X = x_0 x_1 \dots x_{N-1}$ of elements in a semigroup In this paper we completely characterize the size

time complexity of computing prefixes with boolean networks which are synchronized interconnections of boolean gates and one bit storage devices This complexity crucially depends upon a property of the underlying semigroup which we call cycle freedom no cycle of length greater than one in the Cayley graph of the semigroup Denoting by S and T size and computation time respectively we have $S \Theta N T \log N T$ for non cycle free semigroups and $S \Theta N T$ for cycle free semigroups In both cases T in $\Omega \log N O N$

Logical Modeling of Cellular Processes: From Software Development to Network Dynamics Matteo Barberis, Tomáš Helikar, 2019-08-16 Mathematical models have become invaluable tools for understanding the intricate dynamic behavior of complex biochemical and biological systems Among computational strategies logical modeling has been recently gaining interest as an alternative approach to address network dynamics Due to its advantages including scalability and independence of kinetic parameters the logical modeling framework is becoming increasingly popular to study the dynamics of highly interconnected systems such as cell cycle progression T cell differentiation and gene regulation Novel tools and standards have been developed to increase the interoperability of logical models which can now be employ to respond a variety of biological questions This Research Topic brings together the most recent and cutting edge approaches in the area of logical modeling including among others novel biological applications software development and model analysis techniques

Quantitative Assessment and Validation of Network Inference Methods in Bioinformatics Benjamin Haibe-Kains, Frank Emmert-Streib, 2015-04-14 Scientists today have access to an unprecedented arsenal of high tech tools that can be used to thoroughly characterize biological systems of interest High throughput omics technologies enable to generate enormous quantities of data at the DNA RNA epigenetic and proteomic levels One of the major challenges of the post genomic era is to extract functional information by integrating such heterogeneous high throughput genomic data This is not a trivial task as we are increasingly coming to understand that it is not individual genes but rather biological pathways and networks that drive an organism s response to environmental factors and the development of its particular phenotype In order to fully understand the way in which these networks interact or fail to do so in specific states disease for instance we must learn both the structure of the underlying networks and the rules that govern their behavior In recent years there has been an increasing interest in methods that aim to infer biological networks These methods enable the opportunity for better understanding the interactions between genomic features and the overall structure and behavior of the underlying networks So far such network models have been mainly used to identify and validate new interactions between genes of interest But ultimately one could use these networks to predict large scale effects of perturbations such as treatment by multiple targeted drugs However currently we are still at an early stage of comprehending methods and approaches providing a robust statistical framework to quantitatively assess the quality of network inference and its predictive potential The scope of this Research Topic in Bioinformatics and Computational Biology aims at addressing these issues by investigating the various complementary approaches to quantify the quality of network

models These validation techniques could focus on assessing quality of specific interactions global and local structures and predictive ability of network models These methods could rely exclusively on in silico evaluation procedures or they could be coupled with novel experimental designs to generate the biological data necessary to properly validate inferred networks
