## Testing Structural Equation Models:

*Testing Structural Equation Models* Kenneth A. Bollen, J. Scott Long, 1993-02 What is the role of fit measures when respecifying a model Should the means of the sampling distributions of a fit index be unrelated to the size of the sample Is it better to estimate the statistical power of the chi square test than to turn to fit indices Exploring these and related questions well known scholars examine the methods of testing structural equation models SEMs with and without measurement error as estimated by such programs as EQS LISREL and CALIS

**Bayesian Estimation and Testing of Structural Equation Models** Richard Scheines, Herbert Hoijtink, Anne Boomsma, 1995 Abstract The Gibbs sampler can be used to obtain samples of arbitrary size from the posterior distribution over the parameters of a structural equation model given covariance data and a prior distribution over the parameters Point estimates standard deviations and interval estimates for the parameters can be computed from these samples If the prior distribution over the parameters is uninformative the posterior is proportional to the likelihood and asymptotically the inferences based on the Gibbs sample are the same as those based on the maximum likelihood solution e.g. output from LISREL or EQS In small samples however the likelihood surface is not multivariate normal and in some cases not even unimodal Nevertheless the Gibbs sampler draws a sample from the true posterior distribution over the parameters regardless of the sample size and the shape of the likelihood surface With an informative prior distribution over the parameters it can be used to estimate underidentified models as we illustrate on a simple errors in variables model
