output through their effects on the marginal utility of tradables consumption This paper assesses the empirical evidence of this approach by deriving an explicit solution for the optimal international portfolio and applying the model to a set of fourteen OECD countries Computing asset returns according to a fundamentals approach it is possible to account for an average gap of no more than 10 15 percentage points between estimated domestic ownership shares and domestic shares under full diversification When stock market data are directly used the predicted coefficient of home bias shrinks to 3% **Southcon Conference Record** ,1996 **Proceedings** ,2004 **Journal of Health, Physical Education, Recreation** ,1946
