Byrtus, L. W. Turchenek, Alberta Innovates - Technology Futures, Simon Fraser University, 2012 Long term soil acidification monitoring was initiated by Alberta Environment in 1981 to track potential effects of acidic atmospheric deposition on soils in Alberta Two sites per year were established for a total of eight sites with baseline sampling completed in 1984 The sites were established each fall at eight locations in the province as follows Fort McMurray Cold Lake High Prairie Bruderheim Devon Rocky Mountain House Esther and Twin Butte In 2008 a ninth site was added in the Fort Saskatchewan Industrial Heartland area in order to provide a better assessment of acidification impacts from major industrial development and oil sands bitumen upgraders proposed for the region The original monitoring design entailed sampling every four years with the design enabling monitoring for a minimum of 44 years The objective of the program was initially to detect subtle changes in soil properties indicative of potentially long term changes in the ability of the soil to sustain plant growth This report presents the data and statistical analysis of six or seven monitoring events up to 2010 Document      [Trends in Soil Acidification in Alberta Based on Long Term Soil Acidification Monitoring from 1981 to 2010](#) Salim A. **Separating Natural Acidity from Anthropogenic Acidification in the Spring Flood of Northern Sweden** Hjalmar Laudon, 2000      Impact Models to Assess Regional Acidification Juha Kämäri, 1990-03-31

Sensitive receptors such as soil and fresh bodies of water are at the end of a long chain of events in the process of regional acidification. This chain begins thousands of kilometers upwind at the emitters of acidifying pollutants. The topics covered in this book are important in the study of regional acidification for two reasons. First it is important to assess the sensitivity of terrestrial and aquatic ecosystems to the deposition of acidifying pollutants. If the sensitivity of an ecosystem is known then international control strategies can be developed to reduce deposition in the receptor areas of greatest importance. This is an important factor in designing the most effective strategies because of the very high costs of reducing emissions of acidifying pollutants. Second it is important to be able to predict changes in ecosystems for decades into the future whether it be an improvement owing to decreases in acidifying emissions or alas a further deterioration because control strategies are nonexistent or inadequate. In either event it is important to be able to judge the results of our actions. Decision makers tend to be mistrustful of models unless they can judge their reliability. The application and testing of the models in Part III of this book cover therefore an important facet of model building.      Vegetational and Ecological Monitoring of Boreal Forests in Norway Tonje Økland, 1990
