Sustainable Technology Development:

Sustainable Technology Development Paul Weaver, Leo Jansen, Philip Vergragt, Geert van Grootveld, Egbert van Spiegel, 2000-04-01 In the time it takes to read this sentence about fifteen people will be added to the world's population. Read the sentence again and there will be thirty. Tomorrow each of these people will be demanding greater prosperity. Production and consumption are increasing fast but will have to grow even faster in the future to keep up with population growth and a world increasingly divided by inequality. How should we react to these trends? Certainly many use growth figures to forecast disaster. But there is an alternative vision: one of a sustainable future in which growth is seen not as a threat but as the driving force behind innovation. This is the scenario worked out in the Netherlands by Sustainable Technology Development (STD), a five-year programme of research and learning by doing based on setting up new innovation networks and working with new methods to search for sustainable technological solutions. In order to make sustainability tangible, STD made a leap in time: What human needs will have to be satisfied fifty years from now? Taking a sustainable future vision as a starting point, STD demonstrated what steps we should take today for new technologies and systems to be in place in time. These results are now available for the first time in a comprehensive, specifically written English language book together with a description of the unique working method of STD and the results and key lessons from a set of the programme's illustrative case studies. This book serves as a manual for industry, governments and social leaders wanting to prepare themselves for a sustainable future. Sustainable Technology Development sets out the programme's underpinning philosophy and describes its approach, methods and findings. Delivering sustainability means finding ways to meet human needs using a fraction of the natural resources we use today. The world's richer nations would be wise to target at least ten-fold improvements by 2050 in the productivity with which conventional natural resources and environmental services are used. And they need to bring new sustainable resources on stream to augment the resource base and replace the use of unsustainable alternatives. Sustainable Technology Development marks a significant contribution to our understanding of innovation processes and how these might be influenced in favour of sustainable technology development. In principle, technology could play a pivotal role in sustainable development. Whether it does or not depends on whether innovators can be encouraged to make this an explicit goal, adopt long-term time horizons and search for renewable technologies. Given the long lead times involved, there is no time to waste in beginning the search. The STD programme has begun to make inroads into one of the most urgent of all needs concerning sustainable development: that for innovation in the innovation process itself.

What is Sustainable Technology? Karel Mulder, Didac Ferrer, Harro van Lente, 2017-09-08 Designers of technology have a major responsibility in the current age. Their designs can have tremendous effects on society in both the short and the long term. In fact, sustainable development itself has all the characteristics of a design project, albeit a vast one. But a failed product design here will be not just be unsuccessful in the market; it will have far-reaching consequences. It is our common

responsibility to make the project successful Technology has played an important role in creating the problems that we now face but it will also play an important role in solving them But this does not mean the technological fix will be easy How do we allocate resources and attention when there are myriad issues under the umbrella of sustainable development currently in competition with one another How do we arrive at precise specifications for the sustainable technologies that are to be developed and furthermore reach consensus on these specifications What if our sustainable technological solutions aggravate other problems or create new ones And because sustainable development is all about the long term consequences of our actions how do we assess the effects of modifying existing landscapes infrastructures and patterns of life How could we be sure in advance that the changes that new technologies bring will make our society more sustainable These dilemmas and paradoxes are the subject of this provocative book Sometimes the claim that a technology is sustainable is made in order to make the technology acceptable in the political process as in the case of nuclear energy production where the claims of sustainability refer to the absence of CO2 emissions In the case of biofuels claims of sustainability have led to a fuel or food debate showing that sustainability has counteracting articulations And the well known rebound effect is observed when increased resource efficiency can create a stimulus for consumption What is Sustainable Technology illustrates that the sustainability impact of a technology is often much more complicated and ambivalent than one might expect Making improvements to existing designs is not the technological challenge that will lead to real solutions We mustn't look to change a part of a machine but rather the machine as a whole or even the whole system in which it functions It is these system innovations that have the potential to make a genuine contribution to sustainable development What is Sustainable Technology will help all those involved in designing more sustainable technologies in determining their strategies It does so by presenting case studies of different technologies in contrasting contexts Each case asks 1 What articulations of sustainability played a role in the design process 2 What sustainability effects did this technology lead to 3 Who was affected where and when 4 Could the designer have foreseen these consequences 5 How did the designer anticipate them 6 How was societal interaction dealt with during the design process Finally the authors reflect on future options for the sustainable technology designer They argue that an important first step is an awareness of the multitude of sustainable development challenges that play a role in production use recycling and end of life disposal What is Sustainable Technology will be essential reading for product designers engineers material scientists and others involved in the development of sustainable technologies as well as a wide academic audience interested in the complexities of the sustainable design process Nature Science and Sustainable Technology, 2008 Nature thrives on diversity and flexibility gaining strength from heterogeneity whereas the quest for homogeneity seems to motivate much of modern engineering Nature is non linear and inherently promotes multiplicity of solutions This new book presents new and original research on true sustainability and technology development **Sustainable Technology Development** Paul Weaver, Leo Jansen, Geert van Grootveld, Philip
