Learning XML Mem Linc, Richard Baker, 2020-09-26 Extensible Markup Language XML is used to describe data The XML standard is a flexible way to create information formats and electronically share structured data via the public Internet as well as via corporate networks XML code a formal recommendation from the World Wide Web Consortium W3C is similar to Hypertext Markup Language HTML Both XML and HTML contain markup symbols to describe page or file contents HTML code describes Web page content mainly text and

graphic images only in terms of how it is to be displayed and interacted with XML data is known as self describing or self defining meaning that the structure of the data is embedded with the data thus when the data arrives there is no need to pre build the structure to store the data it is dynamically understood within the XML The XML format can be used by any individual or group of individuals or companies that want to share information in a consistent way XML is actually a simpler and easier to use subset of the Standard Generalized Markup Language SGML which is the standard to create a document structure The basic building block of an XML document is an element defined by tags An element has a beginning and an ending tag All elements in an XML document are contained in an outermost element known as the root element XML can also support nested elements or elements within elements This ability allows XML to support hierarchical structures Element names describe the content of the element and the structure describes the relationship between the elements An XML document is considered to be well formed that is able to be read and understood by an XML parser if its format complies with the XML specification if it is properly marked up and if elements are properly nested XML also supports the ability to define attributes for elements and describe characteristics of the elements in the beginning tag of an element

Programming Web Services with XML-RPC Simon St. Laurent,Joe Johnston,Edd Wilder-James,Dave Winer,2001-06-21

Have you ever needed to share processing between two or more computers running programs written in different languages on different operating systems Or have you ever wanted to publish information on the Web so that programs other than browsers could work with it XML RPC a system for remote procedure calls built on XML and the ubiquitous HTTP protocol is the solution you ve been looking for Programming Web Services with XML RPC introduces the simple but powerful capabilities of XML RPC which lets you connect programs running on different computers with a minimum of fuss by wrapping procedure calls in XML and establishing simple pathways for calling functions With XML RPC Java programs can talk to Perl scripts which can talk to Python programs ASP applications and so on You can provide access to procedure calls without having to worry about the system on the other end so it s easy to create services that are available on the Web XML RPC isn t the only solution for web services the Simple Object Access Protocol SOAP is another much hyped protocol for implementing web services While XML RPC provides fewer capabilities than SOAP it also has far fewer interoperability problems and its capabilities and limitations are much better understood XML RPC is also stable with over 30 implementations on a wide variety of platforms so you can start doing real work with it immediately Programming Web Services with XML RPC covers the details of five XML RPC implementations so you can get started developing distributed applications in Java Perl Python ASP or PHP The chapters on these implementations contain code examples that you can use as the basis for your own work This book also provides in depth coverage of the XML RPC specification which is helpful for low level debugging of XML RPC clients and servers And if you want to build your own XML RPC implementation for another environment the detailed explanations in this book will serve as a foundation for that work
