The Analysis of Variance Hardeo Sahai, Mohammed I. Ageel, 2012-12-06 The analysis of variance ANOVA models have become one of the most widely used tools of modern statistics for analyzing multifactor data The ANOVA models provide versatile statistical tools for studying the relationship between a dependent variable and one or more independent variables The ANOVA models are employed to determine whether different variables interact and which factors or factor combinations are most important They are appealing because they provide a conceptually simple technique for investigating statistical relationships among different independent variables known as factors Currently there are several texts and monographs available on the subject However some of them such as those of Scheffe 1959 and Fisher and McDonald 1978 are written for mathematically advanced readers requiring a good background in calculus matrix algebra and statistical theory whereas others such as Guenther 1964 Huitson 1971 and Dunn and Clark 1987 although they assume only a background in elementary algebra and statistics treat the subject somewhat scantily and provide only a superficial discussion of the random and mixed effects analysis of variance

Optimum Timeframes for Detecting Songbird Vocalizations in the Black Hills Todd R. Mills, 2000 Birds are indicators of vegetation structure and ecological conditions The singing activity of birds declines during late morning periods which can affect estimates of abundance and conclusions regarding vegetative conditions indexed by birds Therefore it is important to quantify periods of bird activity so biologists can plan studies We determined hourly detections from singing males of 22 nongame bird species in ponderosa pine quaking aspen and grassland vegetation types in the Black Hills of South Dakota Detections of 12 of 22 species differed among 1 hr intervals after sunrise Detections of yellowrumped warblers Townsend s solitaires red breasted nuthatches western tanagers and American robins decreased on count episodes more than 4 hrs after sunrise Detections of dusky flycatchers declined on count episodes more than 3 hrs after sunrise and detections of black capped chickadees were greatest during the first hour after sunrise and declined afterward Detections of many other species from songs or calls decreased on count episodes more than 5 hrs after sunrise We recommend that bird counts in the Black Hills be completed within 4 hrs after sunrise so estimates of bird abundance are not affected by reduced singing among males

Wildlife Study Design Michael L.

Morrison, William M. Block, M. Dale Strickland, Bret A. Collier, Markus J. Peterson, 2008-05-25 We developed the first edition of this book because we perceived a need for a compilation on study design with application to studies of the ecology conservation and management of wildlife We felt that the need for coverage of study design in one source was strong and although a few books and monographs existed on some of the topics that we covered no single work attempted to synthesize the many facets of wildlife study design We decided to develop this second edition because our original goal synthesis of study design remains strong and because we each gathered a substantial body of new material with which we could update and expand each chapter Several of us also used the first edition as the basis for workshops and graduate teaching which provided us with many valuable suggestions from readers on how to improve the text In particular Morrison received a detailed review from the graduate students in his Wildlife Study Design course at Texas A M University We also paid heed to the reviews of the first edition that appeared in the literature

Asian Fisheries Science ,2001 **Vegetative Characteristics of Swift Fox Denning and Foraging Sites in Southwestern South Dakota** Daniel W. Uresk, 2003 Vegetative characteristics of swift fox *Vulpes velox* denning and foraging habitats were studied in southwestern South Dakota We followed 14 radio collared foxes over a two year period and identified 17 den sites and 82 foraging sites Height density of vegetation visual obstruction reading VOR was determined on each den and foraging site and on 81 randomly selected sites Total vegetation VOR was higher $p < 0.08$ at den sites than on randomly selected sites 11 7 1 4 and 9 5 0 6 cm SE respectively Swift foxes used foraging areas with vegetation greater VOR $p < 0.01$ than that found on randomly selected sites 11 9 0 7 and 9 5 0 6 cm respectively Canopy cover for seven major plant species on foraging sites was different than on den sites $p < 0.055$ but random sites were not different from either foraging or den sites While previous studies have described swift fox macrohabitats with little vegetative cover e.g. plowed fields or heavily grazed areas our study showed that height density of vegetation is important to these foxes
