Stochastic Finite Elements A Spectral Approach:

Stochastic Finite Elements Roger G. Ghanem, Pol D. Spanos, 2003-01-01 This text analyzes a class of discrete mathematical models of engineering systems identifying key issues and reviewing relevant theoretical concepts with particular attention to a spectral approach 1991 edition

Stochastic Finite Elements: A Spectral Approach Roger G. Ghanem, Pol Spanos, 2011-11-25 This monograph considers engineering systems with random parameters Its context format and timing are correlated with the intention of accelerating the evolution of the challenging field of Stochastic Finite Elements The random system parameters are modeled as second order stochastic processes defined by their mean and covariance functions Relying on the spectral properties of the covariance function the Karhunen Loeve expansion is used to represent these processes in terms of a countable set of uncorrelated random variables Thus the problem is cast in a finite dimensional setting Then various spectral approximations for the stochastic response of the system are obtained based on different criteria Implementing the concept of Generalized Inverse as defined by the Neumann Expansion leads to an explicit expression for the response process as a multivariate polynomial functional of a set of uncorrelated random variables Alternatively the solution process is treated as an element in the Hilbert space of random functions in which a spectral representation in terms of the Polynomial Chaos is identified In this context the solution process is approximated by its projection onto a finite subspace spanned by these polynomials

Proceedings of the International Symposium on Engineering under Uncertainty: Safety Assessment and Management (ISEUSAM - 2012) Subrata Chakraborty, Gautam Bhattacharya, 2013-03-12 International Symposium on Engineering under Uncertainty Safety Assessment and Management ISEUSAM 2012 is organized by Bengal Engineering and Science University India during the first week of January 2012 at Kolkata The primary aim of ISEUSAM 2012 is to provide a platform to facilitate the discussion for a better understanding and management of uncertainty and risk encompassing various aspects of safety and reliability of engineering systems The conference received an overwhelming response from national as well as international scholars experts and delegates from different parts of the world Papers received from authors of several countries including Australia Canada China Germany Italy UAE UK and USA besides India More than two hundred authors have shown their interest in the symposium The Proceedings presents ninety two high quality papers which address issues of uncertainty encompassing various fields of engineering i e uncertainty analysis and modelling structural reliability geotechnical engineering vibration control earthquake engineering environmental engineering stochastic dynamics transportation system system identification and damage assessment and infrastructure engineering

IUTAM Symposium on the Vibration Analysis of Structures with Uncertainties Alexander K. Belyaev, Robin S. Langley, 2010-12-02 The Symposium was aimed at the theoretical and numerical problems involved in modelling the dynamic response of structures

which have uncertain properties due to variability in the manufacturing and assembly process with automotive and aerospace structures forming prime examples It is well known that the difficulty in predicting the response statistics of such structures is immense due to the complexity of the structure the large number of variables which might be uncertain and the inevitable lack of data regarding the statistical distribution of these variables The Symposium participants presented the latest thinking in this very active research area and novel techniques were presented covering the full frequency spectrum of low mid and high frequency vibration problems It was demonstrated that for high frequency vibrations the response statistics can saturate and become independent of the detailed distribution of the uncertain system parameters A number of presentations exploited this physical behaviour by using and extending methods originally developed in both phenomenological thermodynamics and in the fields of quantum mechanics and random matrix theory For low frequency vibrations a number of presentations focussed on parametric uncertainty modelling for example probabilistic models interval analysis and fuzzy descriptions and on methods of propagating this uncertainty through a large dynamic model in an efficient way At mid frequencies the problem is mixed and various hybrid schemes were proposed It is clear that a comprehensive solution to the problem of predicting the vibration response of uncertain structures across the whole frequency range requires expertise across a wide range of areas including probabilistic and non probabilistic methods interval and info gap analysis statistical energy analysis statistical thermodynamics random wave approaches and large scale computations and this IUTAM symposium presented a unique opportunity to bring together outstanding international experts in these fields

description of the problem are not capable of handling time dependent random properties unless the variation can be expressed in terms of a few random variables On the other hand response statistics of systems in random parametric vibration are often useful to designers and analysts However current approaches which could be used to compute these response statistics are slow inaccurate or unfeasible This work offers a new statistical approach to obtain response statistics of linear dynamic systems in random parametric vibration This approach called the random matrix method is a distant cousin to an existing Taylor expansion perturbation approach but is faster more efficient more accurate and more stochastically stable it is also superior to Monte Carlo approaches The random matrix method first discretizes the problem so that the equations of motion can be expressed as a random matrix equation Statistics of an inverse matrix are obtained using a Neumann expansion and response statistics can be obtained from the statistics of the load and the inverse matrix This method is capable of analysis in either the frequency or time domain and can handle both stationary and nonstationary load and properties Three different problems with time dependent properties will be analyzed by the random matrix method and by Monte Carlo techniques for comparison First response statistics will be obtained for a generic single degree of freedom oscillator with stationary stiffness and load Then the ride comfort of a car a multiple degree of freedom system with stationary tire stiffness will be investigated Finally a fatigue damage analysis of a light aircraft s landing gear will be conducted note that this problem involves a single degree of freedom system with nonstationary random damping and load In all cases the magnitude of random property effects on response will be examined to see if random properties need to be taken into account for these systems
