Recent

Advances in Nonlinear Dynamics and Synchronization Kyandoghene Kyamakya, Herwig Unger, Jean Chamberlain Chedjou, Nikolai F. Rulkov, Zhong Li, 2009-09-30 In essence the dynamics of real world systems i e engineered systems natural systems social systems etc is nonlinear The analysis of this nonlinear character is generally performed through both observational and modeling processes aiming at deriving appropriate models mathematical logical graphical etc to simulate or mimic the spatiotemporal dynamics of the given systems The complex intrinsic nature of these systems i e nonlinearity and spatiotemporal dynamics can lead to striking dynamical behaviors such as regular or irregular stable or unstable periodicity or multi periodicity torus or chaotic dynamics The various potential applications of the knowledge about such dynamics in technical sciences engineering are being intensively demonstrated by diverse ongoing research activities worldwide However both the modeling and the control of the nonlinear dynamics in a range of systems is still not yet well understood e g system models with time varying coefficients immune systems swarm intelligent systems chaotic and fractal systems stochastic systems self organized systems etc This is due amongst others to the challenging task of establishing a precise and systematic fundamental or theoretical framework e g methods and tools to analyze understand explain and predict the nonlinear dynamical behavior of these systems in some cases even in real time The full insight in systems nonlinear dynamic behavior is generally achieved through approaches involving analytical numerical and or experimental methods
