Digital System Test and Testable Design Zainalabedin Navabi,2010-12-10 This book is about digital system testing and testable design The concepts of testing and testability are treated together with digital design practices and methodologies The book uses Verilog models and testbenches for implementing and explaining fault simulation and test generation algorithms Extensive use of Verilog and Verilog PLI for test applications is what distinguishes this book from other test and testability books Verilog eliminates ambiguities in test algorithms and BIST and DFT hardware architectures and it clearly describes the architecture of the testability hardware and its test sessions Describing many of the on chip decompression algorithms in Verilog helps to evaluate these algorithms in terms of hardware overhead and timing and thus feasibility of using them for System on Chip designs Extensive use of testbenches and testbench development techniques is another unique feature of this book Using PLI in developing testbenches and virtual testers provides a powerful programming tool interfaced with hardware described in Verilog This mixed hardware software environment facilitates description of complex test programs and test strategies

System-level Test and Validation of Hardware/Software Systems Matteo Sonza Reorda,Zebo Peng,Massimo

Violante,2006-03-30 New manufacturing technologies have made possible the integration of entire systems on a single chip This new design paradigm termed system on chip SOC together with its associated manufacturing problems represents a real challenge for designers SOC is also reshaping approaches to test and validation activities These are beginning to migrate from the traditional register transfer or gate levels of abstraction to the system level Until now test and validation have not been supported by system level design tools so designers have lacked the infrastructure to exploit all the benefits stemming from the adoption of the system level of abstraction Research efforts are already addressing this issue This monograph provides a state of the art overview of the current validation and test techniques by covering all aspects of the subject including modeling of bugs and defects stimulus generation for validation and test purposes including timing errors design for testability

Harrison,1996 *19th IEEE VLSI Test Symposium* ,2001 Collects 58 papers from the April May 2001 symposium that explore new approaches in the testing of electronic circuits and systems Key areas in testing are discussed such as BIST analog measurement fault tolerance diagnosis methods scan chain design memory test and diagnosis and test data compression and compaction Also on the program are sessions on emerging areas that are gaining prominence including low power testing testing high speed circuits on low cost testers processor based self test techniques and core based system on chip testing Some of the topics are robust and low cost BIST architectures for sequential fault testing in datapath multipliers a method for measuring the cycle to cycle period jitter of high frequency clock signals fault equivalence identification using redundancy information and static and dynamic extraction and test scheduling for minimal energy consumption under power constraints No subject index c Book News Inc

Hybrid Code-Based Test Data Compression and Decompression for VLSI Circuits Kalamani Chinnappa Gounder,2018-06-27 Doctoral Thesis Dissertation from the year 2018 in the subject Computer Science Applied grade 6 Anna University course PhD language English abstract Test data compression is an effective method for reducing test data volume and memory requirement with relatively small cost An effective test structure for embedded hard cores is easy to implement and it is also capable of producing high quality tests as part of the design flow The purpose of Test data compression intends to reduce Test data volume by using Test Stimulus Compression such as Code based schemes Linear decompression based schemes and Broadcast scan based schemes The research work addresses the problem of the test data volume and memory requirements The primary objective of this study is to introduce novel techniques that improve the compression ratio by reducing test data volume during at speed test in scan designs This in turn diminishes the tester memory requirement and hence chip area is reduced for Built in Self Test environment The aim of this research is to introduce various compression algorithms by combining the existing data compression techniques The algorithms are designed to reduce the volume of test patterns of input that is essential to
