Splines And Variational Methods:

Splines and Variational Methods P. M. Prenter, 2013-11-26 One of the clearest available introductions to variational methods this text requires only a minimal background in calculus and linear algebra Its self contained treatment explains the application of theoretic notions to the kinds of physical problems that engineers regularly encounter The text s first half concerns approximation theoretic notions exploring the theory and computation of one and two dimensional polynomial and other spline functions Later chapters examine variational methods in the solution of operator equations focusing on boundary value problems in one and two dimensions Additional topics include least squares and other Galerkin methods Many helpful definitions examples and exercises appear throughout the book A classic reference in spline theory this volume will benefit experts as well as students of engineering and mathematics

Variational Theory of Splines Anatoly Yu. Bezhaev, Vladimir A. Vasilenko, 2013-04-18 This book is a systematic description of the variational theory of splines in Hilbert spaces All central aspects are discussed in the general form existence uniqueness characterization via reproducing mappings and kernels convergence error estimations vector and tensor hybrids in splines dimensional reducing traces of splines onto manifolds etc All considerations are illustrated by practical examples In every case the numerical algorithms for the construction of splines are demonstrated

Spline Models for Observational Data Grace Wahba, 1990-01-01 This book serves well as an introduction into the more theoretical aspects of the use of spline models It develops a theory and practice for the estimation of functions from noisy data on functionals The simplest example is the estimation of a smooth curve given noisy observations on a finite number of its values The estimate is a polynomial smoothing spline By placing this smoothing problem in the setting of reproducing kernel Hilbert spaces a theory is developed which includes univariate smoothing splines thin plate splines in d dimensions splines on the sphere additive splines and interaction splines in a single framework A straightforward generalization allows the theory to encompass the very important area of Tikhonov regularization methods for ill posed inverse problems Convergence properties data based smoothing parameter selection confidence intervals and numerical methods are established which are appropriate to a wide variety of problems which fall within this framework Methods for including side conditions and other prior information in solving ill posed inverse problems are included Data which involves samples of random variables with Gaussian Poisson binomial and other distributions are treated in a unified optimization context Experimental design questions i e which functionals should be observed are studied in a general context Extensions to distributed parameter system identification problems are made by considering implicitly defined functionals *Finite*

Variational Based Analysis and Modelling Using B-splines, 2005 The use of energy methods and variational principles is widespread in many fields of engineering of which structural mechanics and curve and surface design are two prominent examples In principle many different types of function can be used as possible trial solutions to a given variational problem but where piecewise polynomial behaviour and user controlled cross segment continuity is either required or desirable B splines serve as a natural choice Although there are many examples of the use of B splines in such situations there is no common thread running through existing formulations that generalises from the one dimensional case through to two and three dimensions We develop a unified approach to the representation of the minimisation equations for B spline based functionals in tensor product form and apply these results to solving specific problems in geometric smoothing and finite element analysis using the Rayleigh Ritz method We focus on the development of algorithms for the exact computation of the minimisation matrices generated by finding stationary values of functionals involving integrals of squares and products of derivatives and then use these to seek new variational based solutions to problems in the above fields By using tensor notation we are able to generalise the methods and the algorithms from curves through to surfaces and volumes The algorithms developed can be applied to other fields where a variational form of the problem exists and where such tensor product B spline functions can be specified as potential solutions
