Optimization of Large Structural Systems George I. N. Rozvany, 2013-11-21 G I N Rozvany ASI Director Professor of Structural Design FB 10 Essen University Essen Germany

Structural optimization deals with the optimal design of all systems that consist at least partially of solids and are subject to stresses and deformations. This integrated discipline plays an increasingly important role in all branches of technology including aerospace, structural, mechanical, civil, and chemical engineering, as well as energy generation and building technology. In fact, the design of most man-made objects ranging from space ships and long span bridges to tennis rackets and artificial organs can be improved considerably if human intuition is enhanced by means of computer-aided systematic decisions. In analysing highly complex structural systems in practice, discretization is unavoidable because closed-form analytical solutions are only available for relatively simple idealized problems. To keep discretization errors to a minimum, it is desirable to use a relatively large number of elements. Modern computer technology enables us to analyse systems with many thousand degrees of freedom. In the optimization of structural systems, however, most currently available methods are restricted to at most a few hundred variables or a few hundred active constraints.

High-Performance Computing for Structural Mechanics and Earthquake/Tsunami Engineering Shinobu Yoshimura, Muneo Hori, Makoto Ohsaki, 2015-10-26

Huge earthquakes and tsunamis have caused serious damage to important structures such as civil infrastructure elements, buildings, and power plants around the globe. To quantitatively evaluate such damage processes and to design effective prevention and mitigation measures, the latest high performance computational mechanics technologies which include terascale to petascale computers can offer powerful tools. The phenomena covered in this book include seismic wave propagation in the crust and soil seismic response of infrastructure elements such as tunnels, considering soil structure interactions, seismic response of high rise buildings, seismic response of nuclear power plants, tsunami run up over coastal towns and tsunami inundation, considering fluid structure interactions. The book provides all necessary information for addressing these phenomena ranging from the fundamentals of high performance computing for finite element methods, key algorithms of accurate dynamic structural analysis, fluid flows with free surfaces and fluid structure interactions to practical applications with detailed simulation results. The book will offer essential insights for researchers and engineers working in the field of computational seismic/tsunami engineering.

Optimization of Large Structural Systems G. I. N. Rozvany, 1993

This is the second of two volumes which examine structural optimization of large structural systems. Topics covered in these volumes include optimality criteria and topology optimization, decomposition methods and approximation concepts, neural networks and parallel processing.

Applications of Supercomputers in Engineering II C. A. Brebbia, D. Howard, Alexander Peters, 1991 **High**

Performance Computing in Structural Engineering Hojjat Adeli, Roesdiman Soegiarso, 1998-11-30 High performance multiprocessor computers provide new and interesting opportunities to solve large scale structural engineering problems. However, the development of new computational models and algorithms that exploit the unique architecture of these machines remains a challenge. High Performance Computing in Structural Engineering explores the use of supercomputers with vectorization and parallel processing capabilities in structural engineering applications. The book focuses on the optimization of large structures subjected to the complicated implicit and discontinuous constraints of commonly used design codes and presents robust parallel algorithms for analysis of these structures. The authors apply the algorithms to and analyze the performance of minimum weight designs of large steel space trusses and moment resisting frames with or without bracings consisting of discrete standard shapes. They clearly show that adroit and judicious use of vectorization techniques can improve the speedup of an optimization algorithm and that parallel processing can lead to even further speedup. With its review of the necessary background material, generous illustrations, and unique content, this is the definitive resource for the analysis and optimization of structure on shared memory multiprocessor computers. By extension, High Performance Computing in Structural Engineering will prove equally valuable in distributed computing on a cluster of workstations. **Proceedings: Industrial supercomputer applications and computations**, 1987
