Structure-Borne Sound L. Cremer, M. Heckl, 2013-03-09 Since structure borne sound plays an important role in noise control material testing and machine diagnosis the relevant properties of the most important elements of a construction plates beams and shells are investigated Measurement techniques equations of motion formulas for wave speeds resonance frequencies impedances transmission coefficients etc are given The different damping mechanisms and the radiation properties are treated The statistical energy analysis SEA is also presented This new edition has been enlarged to include also waves on orthotropic plates and the vibration and radiation of cylindrical shells **Structure-Borne Sound** L.

Cremer, M. Heckl, Björn A.T. Petersson, 2005-01-17 Structure Borne Sound is a thorough introduction to structural vibrations with emphasis on audio frequencies and the associated radiation of sound The book presents in depth discussions of fundamental principles and basic problems in order to enable the reader to understand and solve his own problems It includes chapters dealing with measurement and generation of vibrations and sound various types of structural wave motion structural damping and its effects impedances and vibration responses of the important types of structures as well as with attenuation of vibrations and sound radiation from structures For the third edition the author fundamentally revised and newly organized the contents of the work Nevertheless the intention has been to preserve the style of the previous editions namely to focus on the fundamentals enabling the reader to analyse further problems *Structure-Borne Sound* L.

**Structure-Borne Sound** Lothar Cremer, Manfred Heckl, 2013-06-29 When the original German edition of this book first appeared in print the undersigned was asked to review it for an English language journal In the course of this review process he was so struck by the book's unusual approach as well as by the realization that no similar collection of information was available in English that he conceived the idea of undertaking this translation Arrangements with the original authors and with the publisher were completed late in 1969 the translation task was begun at that time and occupied nearly two and one half years largely because the undersigned's other professional activities permitted him to devote only his spare time to the translation effort Because this passage of time also brought with it some advances in the state of the art an attempt was made to include the most significant of these advances as well as newer references and some minor corrections in the translated version Except for these changes which were made with the enthusiastic endorsement and collaboration of the

original authors the translated version remains very close to the original In fact the translator took special care to preserve not only the meaning but also the flavor of the original text The translator is most grateful to Professor L Cremer and Dr

Jean-Michel Mondot,1986      **Structure-borne Sound Sources in Buildings** Matthias Lievens,2013

*Structure borne sound sources* are vibrational sources connected in some way to the building structure The mechanical excitation of the building structure leads to sound radiation This is an important source of annoyance in modern light weight buildings The prediction of the sound pressure level from structure borne sound sources is highly complicated because of the complexity involved in the coupling between source and receiver structure The current standard on characterisation of service equipment in buildings EN 12354 5 can deal with sources on heavy structures high mobility source but to date there is no engineering method available for the case of coupling between source and receiver A case study of a washing machine on a wooden joist floor is investigated in this thesis In the first part measurements in the coupled state are conducted It is shown that the normal components are sufficient to predict the sound pressure level However this only applies to the coupled state In the second part a true prediction is calculated from independently measured source and receiver quantities The difference between predicted and directly measured sound pressure level leads to considerable errors of up to 20 dB at low frequencies This shows that the normal components are not sufficient to predict the coupling between a washing machine and a wooden floor      Mechanical and Electrical Equipment for Buildings Walter T. Large structures such as factories, gymnasiums, concert halls, bridges, towers, masts, and chimneys can be detrimentally affected by vibrations. These vibrations can cause either serviceability problems severely hampering the user's comfort or safety problems. The aim of this book is to provide structural and civil engineers working in construction and environmental engineering with practical guidelines for counteracting vibration problems. Dynamic actions are considered from the following sources of vibration: human body motions, rotating, oscillating, and impacting machines, wind flow, road traffic, railway traffic, and construction work. The main section of the book presents tools that aid in decision making and in deriving simple solutions to cases of frequently occurring normal vibration problems. Complex problems and more advanced solutions are also considered. In all cases, these guidelines should enable the engineer to decide on appropriate solutions expeditiously. The appendices of the book contain fundamentals essential to the main chapters.

**Structure-borne Sound in Buildings** D. I. Evans, University of Heriot-Watt, 1986

**Design Acoustics** Gh. Reza Sinambari, 2023-04-12

This technical book focuses on the acoustic analysis of weak points in a comprehensible manner. This reliably helps the designer and acoustician to understand the noise development of machines and systems and to develop suitable primary and secondary noise reduction measures. Selected application examples from practice support the user in developing his own ideas for the implementation of product-related noise reductions.

*Environmental and Architectural Acoustics* Z. Maekawa, Jens Rindel, P. Lord, 2010-12-14

Adopting a multi-disciplinary approach to the practice of achieving a more acceptable acoustic environment, this book draws on the same basic principles to cover both the outdoors and indoor space. It starts with the fundamentals of sound waves and hearing and goes on to the measurement of noise and vibration, room acoustics, sound absorption, and air.

**BUILDING SYSTEMS FOR INTERIOR DESIGNERS** Make design decisions informed by technical and structural knowledge with this essential guide. Professional interior design demands more than simply an understanding of aesthetic and artistic considerations; it also requires a detailed understanding of building systems and their interactions. Design decisions must account for mechanical and

electrical equipment building components and structural elements all of which can potentially shape a designer's work Building Systems for Interior Designers has long stood as the key to understanding and evaluating these elements particularly key building systems like HVAC and plumbing and their impacts on interior design This Fourth Edition is fully updated to fit the needs of the CIDA certified interior design program and the NCIDQ exam The fourth edition of Building Systems for Interior Designers also includes Updated information on sustainable and energy efficient design Detailed coverage of topics including security concerns fire safety and designing secure spaces Classroom supplements including sample construction documents chapter specific discussion questions and more Building Systems for Interior Designers is ideal for students in interior design courses and new professionals studying for NCIDQ exams
