Structured Matrices And Polynomials Unified Superfast Algorithms:

Structured Matrices and Polynomials Victor Y. Pan, 2012-12-06 Structured matrices serve as a natural bridge between the areas of algebraic computations with polynomials and numerical matrix computations allowing cross fertilization of both fields This book covers most fundamental numerical and algebraic computations with Toeplitz Hankel Vandermonde Cauchy and other popular structured matrices Throughout the computations the matrices are represented by their compressed images called displacements enabling both a unified treatment of various matrix structures and dramatic saving of computer time and memory The resulting superfast algorithms allow further dramatic parallel acceleration using FFT and fast sine and cosine transforms Included are specific applications to other fields in particular superfast solutions to various fundamental problems of computer algebra the tangential Nevanlinna Pick and matrix Nehari problems The primary intended readership for this work includes researchers algorithm designers and advanced graduate students in the fields of computations with structured matrices computer algebra and numerical rational interpolation The book goes beyond research frontiers and apart from very recent research articles includes yet unpublished results To serve a wider audience the presentation unfolds systematically and is written in a user friendly engaging style Only some preliminary knowledge of the fundamentals of linear algebra is required This makes the material accessible to graduate students and new researchers who wish to study the rapidly exploding area of computations with structured matrices and polynomials Examples tables figures exercises extensive bibliography and index lend this text to classroom use or self study

Matrix Methods: Theory, Algorithms And Applications - Dedicated To The Memory Of Gene Golub Vadim Olshevsky, Eugene E Tyrtyshnikov, 2010-04-05 Compared to other books devoted to matrices this volume is unique in covering the whole of a

trptych consisting of algebraic theory algorithmic problems and numerical applications all united by the essential use and urge for development of matrix methods This was the spirit of the 2nd International Conference on Matrix Methods and Operator Equations from 23-27 July 2007 in Moscow that was organized by Dario Bini Gene Golub Alexander Guterman Vadim Olshevsky Stefano Serra Capizzano Gilbert Strang and Eugene Tyrtyshnikov Matrix methods provide the key to many problems in pure and applied mathematics However linear algebra theory numerical algorithms and matrices in FEM BEM applications usually live as if in three separate worlds In this volume maybe for the first time ever they are compiled together as one entity as it was at the Moscow meeting where the algebraic part was impersonated by Hans Schneider algorithms by Gene Golub and applications by Guri Marchuk All topics intervened in plenary sessions are specially categorized into three sections of this volume The soul of the meeting was Gene Golub who rendered a charming Golub's dimension to the three main axes of the conference topics This volume is dedicated in gratitude to his memory

Numerical Methods for Roots of Polynomials - Part II J.M. McNamee, V.Y. Pan, 2013-07-19 The zeros of a polynomial can be readily recovered from its linear factors The linear factors can be approximated by first splitting a polynomial numerically into the product of its two nonconstant factors and then recursively splitting every computed nonlinear factor in similar fashion For both the worst and average case inputs the resulting algorithms solve the polynomial factorization and root finding problems within fixed sufficiently small error bounds by using nearly optimal arithmetic and Boolean time that is using nearly optimal numbers of arithmetic and bitwise operations in the case of a polynomial with integer coefficients and simple roots we can immediately extend factorization to root isolation that is to computing disjoint covering discs one for every root on the complex plane The presented algorithms compute highly accurate approximations to all roots nearly as fast as one reads the input coefficients Furthermore our algorithms allow processor efficient parallel acceleration which enables root finding factorization and root isolation in polylogarithmic arithmetic and Boolean time The chapter thoroughly covers the design and analysis of these algorithms including auxiliary techniques of independent interest At the end we compare the presented polynomial root finders with alternative ones in particular with the popular algorithms adopted by users based on supporting empirical information We also comment on some promising directions to further progress
