Airplane Structures Alfred Salem Niles, Joseph Shipley Newell, 1929 *Shape, Contour and Grouping in Computer Vision* David A. Forsyth, Joseph L. Mundy, Vito di Gesu, Roberto Cipolla, 1999-11-03 Computer vision has been successful in several important applications recently Vision techniques can now be used to build very good models of buildings from pictures quickly and easily to overlay operation planning data on a neuro geon s view of a patient and to recognise some of the gestures a user makes to a computer Object recognition remains a very difficult problem however The key questions to understand in recognition seem to be 1 how objects should be represented and 2 how to manage the line of reasoning that stretches from image data to object identity An important part of the process of recognition perhaps almost all of it involves assembling bits of image information into helpful groups There is a wide variety of possible criteria by which these groups could be established a set of edge points that has a symmetry could be one useful group others might be a collection of pixels shaded in a particular way or a set of pixels with coherent colour or texture Discussing this process of grouping requires a detailed understanding of the relationship between what is seen in the image and what is actually out there in the world
