**50 Years of Structure and Bonding - The Anniversary Volume** D. Michael P. Mingos, 2016-10-06 Chemical structure and bonding The scope of the series spans the entire Periodic Table and addresses structure and bonding issues associated with all of the elements It also focuses attention on new and developing areas of modern structural and theoretical chemistry such as nanostructures molecular electronics designed molecular solids surfaces metal clusters and supramolecular structures Physical and spectroscopic techniques used to determine examine and model structures fall within the purview of Structure and Bonding to the extent that the focus is on the scientific results obtained and not on specialist information concerning the techniques themselves Issues associated with the development of bonding models and generalizations that illuminate the reactivity pathways and rates of chemical processes are also relevant The individual volumes in the series are thematic The goal of each volume is to give the reader whether at a university or in industry a comprehensive overview of an area where new insights are emerging that are of interest to a larger scientific audience Thus each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole The most significant developments of the last 5 to 10 years should be presented using selected examples to illustrate the principles discussed A description of the physical basis of the experimental techniques that have been used to provide the primary data may also be appropriate if it has not been covered in detail elsewhere The coverage need not be exhaustive in data but should rather be conceptual concentrating on the new principles being developed that will allow the reader who is not a specialist in the area covered to understand the data presented Discussion of possible future research directions in the area is welcomed Review articles for the individual volumes are invited by the volume editors

**Biophysical and Biochemical Aspects of Fluorescence Spectroscopy** T.G. Dewey, 2013-06-29 Fluorescence spectroscopy has traditionally found wide application in bio chemistry and cell biology Since there are relatively few naturally occurring fluorescent biomolecules fluorescence spectroscopy offers a combination of great specificity and sensitivity Historically these features have been exploited with great success utilizing both intrinsic and extrinsic probes Recent applications have built upon these traditional strengths and have resulted in the development of new instrumental techniques novel and convenient fluorescent probes and a deeper theoretical understanding of fundamental processes Frequently fluorescence techniques are tailored to attack a specific biological problem These new methods in turn produce new physical situations and phenomena which are often of interest to the physical chemist Thus progress in one area stimulates renewed interest in other areas The goal of this book is to provide detailed monographs on the use of fluorescence to investigate problems at the forefront of biochemistry and cell biology This book is not meant to be a comprehensive survey but rather to highlight areas of recent developments It is designed to be readable to the novice and yet provide sufficient detail for the expert to keep abreast of recent developments The book is organized so that it proceeds

from simple biochemical systems to more complex cell biological ones Chapter I on fluorescence quenching of biological structures is a good introductory chapter It introduces a number of elementary concepts and discusses applications to proteins and biomembranes *Structure And Bonding Vol 4* C. Prince, 2004-01-16

International Tables for Crystallography is the definitive resource and reference work for crystallography and structural science. Each of the volumes in the series contains articles and tables of data relevant to crystallographic research and to applications of crystallographic methods in all sciences concerned with the structure and properties of materials. Emphasis is given to symmetry, diffraction methods and techniques of crystal structure determination and the physical and chemical properties of crystals. The data are accompanied by discussions of theory, practical explanations and examples, all of which are useful for teaching. Volume C provides the mathematical, physical and chemical information needed for experimental studies in structural crystallography. This volume covers all aspects of experimental techniques using all three principal radiation types: X-ray, electron and neutron, from the selection and mounting of crystals and production of radiation through data collection and analysis to interpretation of results. Each chapter is supported by a substantial collection of references and the volume ends with a section on precautions against radiation injury. Eleven chapters have been revised, corrected or updated for the third edition of Volume C. More information on the series can be found at <http://it.iucr.org>.
