We reduce this to a normal form $z \to az$ or $z \to z + b$ by means of an appropriate linear transformation of z. Then we obtain a d-closed meromorphic 1-form $z^{-1}dz$ or dz defined on S. Since S contains no curve, $z^{-1}dz$ or dz is holomorphic. This contradicts that the first Betti number of S is equal to 1, q.e.d.

STRUCTURE THEORY FOR A CLASS OF JORDAN ALGEBRAS

By N. Jacobson

DEPARTMENT OF MATHEMATICS, YALE UNIVERSITY

In this note, we shall give a structure theory for a class of Jordan algebras which corresponds rather closely to the class of semisimple Artinian rings in the associative theory. Throughout the paper, "algebra" will mean algebra over a field Φ of characteristic not two, which is not necessarily associative or of finite dimensionality. For Jordan algebras we write $a \cdot b$ for the product, so the defining identities are: $a \cdot b = b \cdot a$, $(a^2 \cdot b) \cdot a = a^2 \cdot (b \cdot a)$, where $a^2 = a \cdot a$. If $\mathfrak{A}$ is an arbitrary algebra with product ab, then we define $a \cdot b = \frac{1}{2}(ab + ba)$ and denote the algebra with this product as $\mathfrak{A}^+$. If $\mathfrak{A}$ is associative, then $\mathfrak{A}^+$ is Jordan. Such Jordan algebras and their subalgebras are called special. An important composition in Jordan algebras is the trilinear product $\{abc\} \equiv (a \cdot b) \cdot c + (b \cdot c) \cdot a - (a \cdot c) \cdot b$. We write U_a for the linear mapping $x \to \{axa\}$, so $U_a = 2R_a^2 - R_{a^2}$, where R_a is $x \to x \cdot a$. We recall the following important identities:

$$\{aba\}^{-2} = \{a\{ba^{-2}b\}a\}. \tag{1}$$

$$U_b{}^n = U_{b^n}, \qquad n = 1,2,3,\ldots \tag{2}$$

$$U_a U_b U_a = U_{bU_a} \cdot{}^1 \tag{3}$$

If $U_{a,b}$ denotes the mapping $x \to \{axb\} = \{bxa\}$, then $U_{a+b} = U_a + U_b + 2U_{a,b}$. If e is an idempotent in the Jordan algebra $\mathfrak{J}$, then it is easily seen that the range $\mathfrak{J}U_e$ of U_e coincides with the Peirce space $\mathfrak{J}_1(e) = \{x | x \cdot e = x\}$. We recall also that if $\mathfrak{J}$ has an identity element 1, then the element $a \in \mathfrak{J}$ is invertible with inverse b if $a \cdot b = 1$, $a^2 \cdot b = a^2$. This relation is symmetric and b is unique. Also, a is invertible if and only if $1 \in \mathfrak{J}U_a$ and if a is invertible with inverse b, then $U_a U_b = 1 =$

Structure Of Algebras:

　　Structure of Algebras Abraham Adrian Albert,1939-12-31 The first three chapters of this work contain an exposition of the Wedderburn structure theorems Chapter IV contains the theory of the commutator subalgebra of a simple subalgebra of a normal simple algebra the study of automorphisms of a simple algebra splitting fields and the index reduction factor theory The fifth chapter contains the foundation of the theory of crossed products and of their special case cyclic algebras The theory of exponents is derived there as well as the consequent factorization of normal division algebras into direct factors of prime power degree Chapter VI consists of the study of the abelian group of cyclic systems which is applied in Chapter VII to yield the theory of the structure of direct products of cyclic algebras and the consequent properties of norms in cyclic fields This chapter is closed with the theory of p algebras In Chapter VIII an exposition is given of the theory of the representations of algebras The treatment is somewhat novel in that while the recent expositions have used representation theorems to obtain a number of results on algebras here the theorems on algebras are themselves used in the derivation of results on representations The presentation has its inspiration in the author s work on the theory of Riemann matrices and is concluded by the introduction to the generalization by H Weyl and the author of that theory The theory of involutorial simple algebras is derived in Chapter X both for algebras over general fields and over the rational field The results are also applied in the determination of the structure of the multiplication algebras of all generalized Riemann matrices a result which is seen in Chapter XI to imply a complete solution of the principal problem on Riemann matrices **Structure of Algebras, by A. connections with Lie algebras which Jacobson details in Chapter 8 Of particular continuing interest is the discussion of exceptional Jordan algebras which serve to explain the exceptional Lie algebras and Lie groups Jordan algebras originally arose in the attempts by Jordan von Neumann and Wigner to formulate the foundations of quantum mechanics They are still useful and important in modern mathematical physics as well as in Lie theory geometry and certain areas of analysis **On the Ideal Structure of Operator Algebras** Reese T.
