Structure Of The Sun:

The Mathematical Structure of Stable Physical Systems Dr. Martin Concoyle, G.P. Coatmundi, 2014-01-16 This book is an introduction to the simple math patterns used to describe fundamental stable spectral orbital physical systems represented as discrete hyperbolic shapes the containment set has many dimensions and these dimensions possess macroscopic geometric properties which are also discrete hyperbolic shapes Thus it is a description which transcends the idea of materialism ie it is higher dimensional and it can also be used to model a life form as a unified high dimension geometric construct which generates its own energy and which has a natural structure for memory where this construct is made in relation to the main property of the description being in fact the spectral properties of both material systems and of the metric spaces which contain the material systems where material is simply a lower dimension metric space and where both material components and metric spaces are in resonance with the containing space Partial differential equations are defined on the many metric spaces of this description but their main function is to act on either the usually unimportant free material components to most often cause non linear dynamics or to perturb the orbits of the quite often condensed material trapped by or within the stable orbits of a very stable hyperbolic metric space shape *Cartography of the Sun and the Stars*

Jean-Pierre Rozelot, Coralie Neiner, 2016-03-11 The mapping of the surface of stars requires diverse skills analysis techniques and advanced modeling i e the collaboration of scientists in various specialties This volume gives insights into new techniques allowing for the first time to obtain resolved images of stars It takes stock of what has been achieved so far in Chile on the ESO VLTI instrument or in the States on the CHARA instrument In recent times interferometry combined with adaptive optics has allowed to reconstruct images of stars Besides the Sun of course by now five stars have been resolved in detail In addition to interferometry this book highlights techniques used for mapping the surfaces of stars using photometry made by space observatories Zeeman and Doppler Imaging mapping the surface element abundances via spectroscopy This book will also take stock of the best images of the solar surface made by connecting the differential rotation to the underlying physical parameters derived from helioseismology Recent measurements of flattening of the solar surface by SDO showed that the Sun s shape is linked to the rotation of the core It is shown how such a result is generalizable to the stars
