Pricing Communication Networks
Costas Courcoubetis, Richard Weber, 2003-07-25 Traditionally engineers devised communication services without reference to how they should be priced In today s environment pricing is a very complex subject and in practice depends on many parameters of the actual market including amount of traffic architecture of the network technology and cost The challenge is to provide a generic service model which accurately captures aspects such as quality and performance and can be used to derive optimal pricing strategies Recent technology advances combined with the deregulation of the telecommunication market and the proliferation of the internet have created a highly competitive environment for communication service providers Pricing is no longer as simple as picking an appropriate model for a particular contract There is a real need for a book that explains the provision of new services the relation between pricing and resource allocation in networks and the emergence of the internet and how to price it Pricing Communication Networks provides a framework of mathematical models for pricing these multidimensional contracts and includes background in network services and contracts network technology basic economics and pricing strategy It can be used by economists to fill in the gaps in their knowledge of network services and technology and for engineers and operational researchers to gain the background in economics required to price communication services effectively Provides a broad overview of network services and contracts Includes a primer on modern network technology and the economic concepts relevant to pricing and competition Includes discussion of mathematical models of traffic flow to help describe network capability and derive pricing strategies Includes coverage of specialist topics such as regulation multicasting and auctions Illustrated throughout by detailed real examples Suitable for anyone with an understanding of basic calculus and probability Primarily aimed at graduate students researchers and practitioners from electrical engineering computer science economics and operations research Pricing Communication Networks will also appeal to telecomms engineers working in industry

Service Provision Kenneth J. Turner, Evan H. Magill, David J. Marples, 2004-05-21 This book provides the first overview of the service technologies available to telecoms operators working in a post convergence world Previous books have focused either on computer networks or on telecoms networks This is the first to bring the two together and provide a single reference source for information that is currently only to be found in disparate journals tool specifications and standards documents In order to provide such broad coverage of the topic in a structured and logical fashion the book is divided into 3 parts The first part looks at the underlying network support for services and aims to explain the technology that makes the user visible services possible This section covers multimedia networking both traditional legacy and future softswitch call processing intelligent networks the Internet and Wireless networks Part 2 deals with how these services may be analysed and managed Chapters cover topics such as commercial issues service management quality of service security standards and APIs Part 3 concludes the book by looking ahead at evolving technologies and more speculative possibilities discussing the kinds of services that may be possible in the future and the technologies that will support them Focuses is on how the technology supports the services rather than on technology for its own sake Contributors drawn from both academia and industry companies such as Marconi BT Telcordia Cisco Analysys to give both theoretical and real world perspectives Unique single reference source for a wide range of material currently found only in disparate papers specs and documentation Covers brand new technologies such as JAIN JTAPI Parlay IP multimedia networking active networks WAP wireless LANs agent based services etc

Voice Over IP Technologies Mark A. Miller, 2002 Voice over IP Technologies provides solid technical information on how to successfully design and implement a converged network combining voice data fax and video transmissions into a cohesive networking infrastructure centered on the Internet Protocol Converged networks which combine voice data fax and video transmissions into a cohesive networking infrastructure all centered on the Internet Protocol or IP promise a number of advantages over existing separate networking environments But to successfully design and implement a converged network requires expertise on both the voice and data networking sides of the house Unfortunately few individuals have these credentials either you are a voice networking expert and familiar with circuit switching and connections between PBXs or you are a data networking expert familiar with packet switching and connections between routers and servers The objective of this text is to bridge the gap between the voice and data networking sides and provide the reader with the opportunity to fill in their areas of weakness with solid technical information In addition this text presents a number of case studies from architectural financial and technical perspectives that illustrate real world applications for these technologies
