Yoo-Sok Saw, 2012-12-06 Rate Quality Optimized Video Coding discusses the matter of optimizing or negotiating the data rate of compressed digital video and its quality which has been a relatively neglected topic in either side of image video coding and tele traffic management Video rate management becomes a technically challenging task since it is required to maintain a certain video quality regardless of the availability of transmission or storage media This is caused by the broadband nature of digital video and inherent algorithmic features of mainstream video compression schemes e g H 261 H 263 and MPEG series In order to maximize the media utilization and to enhance video quality the data rate of compressed video should be regulated within a budget of available media resources while maintaining the video quality as high as possible In Part I Chapters 1 to 4 the non stationarity of digital video is discussed Since the non stationary nature is also inherited from algorithmic properties of international video coding standards which are a combination of statistical coding techniques the

video rate management techniques of these standards are explored. Although there is a series of known video rate control techniques such as picture rate variation, frame dropping, etc., these techniques do not view the matter as an optimization between rate and quality. From the view of rate quality optimization, the quantizer is the sole means of controlling rate and quality. Thus, quantizers and quantizer control techniques are analyzed based on the relationship of rate and quality. In Part II, Chapters 5 and 6, as a coherent approach to non-stationary video established but still thriving nonlinear techniques are applied to video rate quality optimization such as artificial neural networks including radical basis function networks and fuzzy logic based schemes. Conventional linear techniques are also described before the nonlinear techniques are explored. By using these nonlinear techniques, it is shown how they influence and tackle the rate quality optimization problem. Finally, in Chapter 7, rate quality optimization issues are reviewed in emerging video communication applications such as video transcoding and mobile video. This chapter discusses some new issues and prospects of rate and quality control in those technology areas.

**Rate Quality Optimized Video Coding** is an excellent reference and can be used for advanced courses on the topic.

**Real-Time Video Compression Techniques and Algorithms** Raymond Westwater, Borko Furht, 2007-08-28. Real Time Video Compression Techniques and Algorithms introduces the XYZ video compression technique which operates in three dimensions, eliminating the overhead of motion estimation. First video compression standards MPEG and H.261, H.263 are described. They both use asymmetric compression algorithms based on motion estimation. Their encoders are much more complex than decoders. The XYZ technique uses a symmetric algorithm based on the Three Dimensional Discrete Cosine Transform (3D DCT). 3D DCT was originally suggested for compression about twenty years ago; however, at that time, the computational complexity of the algorithm was too high, it required large buffer memory, and was not as effective as motion estimation. We have resurrected the 3D DCT based video compression algorithm by developing several enhancements to the original algorithm. These enhancements make the algorithm feasible for real time video compression in applications such as video on demand, interactive multimedia, and videoconferencing. The demonstrated results presented in this book suggest that the XYZ video compression technique is not only a fast algorithm but also provides superior compression ratios and high quality of the video compared to existing standard techniques such as MPEG and H.261, H.263. The elegance of the XYZ technique is in its simplicity, which leads to inexpensive VLSI implementation of any XYZ codec.

**Real Time Video Compression Techniques and Algorithms** can be used as a text for graduate students and researchers working in the area of real time video compression. In addition, the book serves as an essential reference for professionals in the field.

**Three-Dimensional Model Analysis and Processing** Faxin Yu, Zheming Lu, Hao Luo, Pinghui Wang, 2011-02-03. With the increasing popularization of the Internet together with the rapid development of 3D scanning technologies and modeling tools, 3D model databases have become more and more common in fields such as biology, chemistry, archaeology, and geography. People can distribute their own 3D works over the Internet, search and download 3D model data, and also carry out electronic trade over the Internet. However, some

serious issues are related to this as follows 1 How to efficiently transmit and store huge 3D model data with limited bandwidth and storage capacity 2 How to prevent 3D works from being pirated and tampered with 3 How to search for the desired 3D models in huge multimedia databases This book is devoted to partially solving the above issues Compression is useful because it helps reduce the consumption of expensive resources such as hard disk space and transmission bandwidth On the downside compressed data must be decompressed to be used and this extra processing may be detrimental to some applications 3D polygonal mesh with geometry color normal vector and texture coordinate information as a common surface representation is now heavily used in various multimedia applications such as computer games animations and simulation applications To maintain a convincing level of realism many applications require highly detailed mesh models However such complex models demand broad network bandwidth and much storage capacity to transmit and store To address these problems 3D mesh compression is essential for reducing the size of 3D model representation

Rate-Distortion Based Video Compression Guido M. Schuster, Aggelos Katsaggelos, 2013-03-09 One of the most intriguing problems in video processing is the removal of the redundancy or the compression of a video signal There are a large number of applications which depend on video compression Data compression represents the enabling technology behind the multimedia and digital television revolution In motion compensated lossy video compression the original video sequence is first split into three new sources of information segmentation motion and residual error These three information sources are then quantized leading to a reduced rate for their representation but also to a distorted reconstructed video sequence After the decomposition of the original source into segmentation motion and residual error information is decided the key remaining problem is the allocation of the available bits into these three sources of information In this monograph a theory is developed which provides a solution to this fundamental bit allocation problem It can be applied to all quad tree based motion compensated video coders which use a first order differential pulse code modulation DPCM scheme for the encoding of the displacement vector field DVF and a block based transform scheme for the encoding of the displaced frame difference DFD An optimal motion estimator which results in the smallest DFD energy for a given bit rate for the encoding of the DVF is also a result of this theory Such a motion estimator is used to formulate a motion compensated interpolation scheme which incorporates a global smoothness constraint for the DVF

Novel Motion Anchoring Strategies for Wavelet-based Highly Scalable Video Compression Dominic Rufenacht, 2018-04-03 A key element of any modern video codec is the efficient exploitation of temporal redundancy via motion compensated prediction In this book a novel paradigm of representing and employing motion information in a video compression system is described that has several advantages over existing approaches Traditionally motion is estimated modelled and coded as a vector field at the target frame it predicts While this

prediction centric approach is convenient the fact that the motion is attached to a specific target frame implies that it cannot easily be re purposed to predict or synthesize other frames which severely hampers temporal scalability In light of this the present book explores the possibility of anchoring motion at reference frames instead Key to the success of the proposed reference based anchoring schemes is high quality motion inference which is enabled by the use of a more physical motion representation than the traditionally employed block motion fields The resulting compression system can support computationally efficient high quality temporal motion inference which requires half as many coded motion fields as conventional codecs Furthermore features beyond compressibility including high scalability accessibility and intrinsic framerate upsampling can be seamlessly supported These features are becoming ever more relevant as the way video is consumed continues shifting from the traditional broadcast scenario to interactive browsing of video content over heterogeneous networks This book is of interest to researchers and professionals working in multimedia signal processing in particular those who are interested in next generation video compression Two comprehensive background chapters on scalable video compression and temporal frame interpolation make the book accessible for students and newcomers to the field
