Tutorial Hard Real-time Systems John A. Stankovic, Krithi Ramamritham, 1988

The Testability of Distributed Real-Time Systems Werner Schütz, 2007-07-23 BY H KOPETZ A real time computer system must provide the intended service in two dimensions the functional value dimension and the temporal dimension The verification of a real time system implementation is thus necessarily more complex than the verification of a non real time system which has to be checked in the value dimension only Since the formal verification techniques of temporal properties have not yet matured to the point where these techniques can be used in practical system development systematic design and testing are the only alternatives for the development of dependable real time systems At present up to and more than fifty percent of the development effort of complex real time computer systems is spent on testing The test activities are thus a significant cost element in any real time system project The attack on this cost element has to proceed from two fronts the design for testability and the development of a systematic test methodology supported by an appropriate tool set This book covers both of these topics

Rugged Embedded Systems Augusto Vega, Pradip Bose, Alper Buyuktosunoglu, 2016-12-02 Rugged Embedded Systems Computing in Harsh Environments describes how to design reliable embedded systems for harsh environments including architectural approaches cross stack hardware software techniques and emerging challenges and opportunities A harsh environment presents inherent characteristics such as extreme temperature and radiation levels very low power and energy budgets strict fault tolerance and security constraints etc that challenge the computer system in its design and operation To guarantee proper execution correct safe and low power in such scenarios this contributed work discusses multiple layers that involve firmware operating systems and applications as well as power management units and communication interfaces This book also incorporates use cases in the domains of unmanned vehicles advanced cars and micro aerial robots and space exploration as examples of computing designs for harsh environments Provides a deep understanding of embedded systems for harsh environments by experts involved in state of the art autonomous vehicle related projects Covers the most important challenges fault tolerance power efficiency and cost effectiveness faced when developing rugged embedded systems Includes case studies exploring embedded computing for autonomous vehicle systems advanced cars and micro aerial robots and space exploration

Realtime Systems Nimal Nissanke,1997 Real Time computing is one of th most demanding and challenging areas in computing It is also of great importance since real time software is indispensable to all ultra reliable and safety critical applications The objective of this book is to provide an introduction to the whole area of real time computing Although it boundaries are bit well defined the body of knowledge relevant to the study of real time systems encompasses a whole range of topics There are issues such as clocks specification design and modelling of real time systems which are exclusive to the study of real time systems There are also a number of fairly independant topics having applications outside real time systems but with a deinite real time dimension The book supplies a framework for the study of real time systems facilitating a higher level of abstraction and a sharper focus on concepts and issued Invariably this framework relies on mathematics but the mathematics are explained and kept to the minimum Most chapters are self contained and each deals with a separate topic The exceptions are Chapters 2 4 since they contain notations and concepts used elsewhere The occasional cross reference between chapters are intended to underlinethe coherence of the material rather than the deponce of topics
