

CORONA

The outermost layer of the solar atmosphere. The corona is made of a tenuous ionized gas called plasma, with temperatures up to a million degrees Fahrenheit. The corona is visible to the naked eye only during a total solar eclipse.

PROMINENCES

Structures in the corona made of relatively cool plasma supported by magnetic fields. Prominences are bright structures when seen over the solar limb, but appear dark when seen against the bright solar disk (where they're called filaments).

HELMET STREAMERS

Large, caplike coronal structures with long pointed peaks that usually lie over sunspots and active regions. These often have a prominence or filament at their base.

POLAR PLUMES

Bright structures of fast-flowing solar material coming from coronal holes, areas with magnetic field lines open to interplanetary space. Coronal holes are more common near, but not exclusive to, the poles.

CORONAL LOOPS

Found around sunspots and in active regions. These structures are associated with the closed magnetic field lines that connect magnetic regions on the solar surface.

Solar Corona:

The Solar Corona Leon Golub, Jay M. Pasachoff, 2010 Intended for graduate students and astronomers seeking an introduction to coronal physics this textbook strikes a balance between the observational and theoretical aspects of the subject This second edition takes into account the major observational and theoretical developments of recent years to provide an up to date treatment of our understanding of the solar corona After reviewing the latest observations of the solar corona the authors explain how the studies have advanced and shaped our understanding of coronal physics The textbook introduces a wide variety of exciting physics including dynamo theory and magnetohydrodynamics and shows how the transient effects of the solar cycle affect space weather Each subject area is introduced using basic physics and refers readers to fundamental papers on the topic key new studies in each area and extensive discussions in recent review articles

Nuclear Science Abstracts, 1975 *A Guide to the Solar Corona* Donald E. Billings, 2013-10-22 A Guide to the Solar Corona is specifically directed to the space scientist or engineer who is not a specialist in solar physics but whose work requires a fairly detailed knowledge of the corona It is hoped that the material may prove useful to most graduate students in astrophysics while solar physicists may find some topics of interest and value to them The book contains 12 chapters and begins with three descriptive chapters that provide the casual reader with a concept of the corona as it is evident through more or less direct observation Topics covered include the development of coronal science observational techniques and observational aspects of the corona The next chapter discusses methods of analyzing coronal data Subsequent chapters present theoretical considerations as they are applicable to the corona These combine theory with observation to provide a description of the various aspects of the corona The final chapter is a combination of established ideas and speculation on the place of the corona in the universe

Physics of the Solar Corona Markus Aschwanden, 2004-09 A thorough introduction to solar physics based on recent spacecraft observations The author introduces the solar corona and sets it in the context of basic plasma physics before moving on to discuss plasma instabilities and plasma heating processes The latest results on coronal heating and radiation are presented Spectacular phenomena such as solar flares and coronal mass ejections are described in detail together with their potential effects on the Earth

Infrared Observations of the Outer Solar Corona Robert M. MacQueen, 1968 The 2.2 microns wavelength outer solar corona has been observed in two experiments first employing a ground based telescope during the 93 second totality of the eclipse of 12 November 1966 and second employing a balloon package with an infrared coronagraph flown to an altitude of 28 km during a 5.25 hour period on 9 January 1967 The design and evaluation of the balloon borne coronagraph is discussed and the various origins of stray light investigated The flight coronagraph was found to introduce a stray radiance of less than 3×10^{-10} to the 12th power B sub dot where B sub dot is the radiance of the mean solar disk at 2.2 microns During eclipse the corona was observed from 2 to 6 solar radii in the

ecliptic plane and at a single point perpendicular to the ecliptic at 5 solar radii Balloon observations covered the range 3 7 to 10 solar radii at position angles from 20 degrees north to 40 degrees south of the ecliptic on the east limb of the sun

Features attributed to the vaporization of interplanetary material were observed at 3 5 4 8 7 and 9 2 solar radii the former two during the period of totality and the latter three during the balloon observations Author **Energy Research**
