**Vacuum Structure in Intense Fields** H.M. Fried, Berndt Muller, 2012-12-06 This Advanced Study Institute ASI brought together two distinct schools of approach to Quantum Electrodynamics QED in the presence of intense external electromagnetic fields in an effort to lay a joint foundation for a needed theoretical explanation of the sharp  $e^+e^-$  resonances observed in the scattering of very heavy Ions These GSI Darmstadt experiments whose history latest reconfirmations and most recent data were presented in three opening sessions Bokemeyer Koenig show a smooth background of positron  $e^+$  production as a function of  $e^-$  kinetic energy Superimposed upon this background are four very sharp peaks of narrow widths 30 KeV and of clear experimental significance 5 standard deviations Most of these peaks correspond to sharp essentially back to back electron positron emission in the ions center of mass Following the approach of supercritical potential theory SPT where the total ionic charge unit  $Z$  satisfies  $Z > 137$  it has been possible to provide a detailed and apparently correct understanding of the smooth  $e^+e^-$  background a coherent description of different facets of this approach emphasizing the nature of the charged supercritical vacuum was described by the authors responsible for the invention of SPT Greiner Muller Rafelski In addition predictions for related phenomena were outlined by other lecturers using the SPT approach Bawin Soff SsJrensen

**Hot Hadronic Matter** Jean Letessier, Hans H. Gutbrod, Johann Rafelski, 2012-12-06 The past decade has seen the development of the operational understanding of fundamental interactions within the standard model This has detoured our attention from the great enigmas posed by the dynamics and collective behavior of strongly interacting particles Discovered more than 30 years ago the thermal nature of the hadronic particle spectra has stimulated considerable theoretical effort which so far has failed to confirm on the basis of microscopic interactions the origins of this phenomenon However a highly successful Statistical Bootstrap Model was developed by Rolf Hagedorn at CERN about 30 years ago which has led us to consider the boiling hadronic matter as a transient state in the transformation of hadronic particles into their melted form which we call Quark Gluon Plasma QGP Today we return to seek detailed understanding of the thermalization processes of hadronic matter equipped on the theoretical side with the knowledge of the fundamental strong interaction theory the quantum chromo dynamics QCD and recognizing the important role of the complex QCD vacuum structure On the other side we have developed new experimental tools in the form of nuclear relativistic beams which allow to create rather extended regions in space time of Hot Hadronic Matter The confluence of these new and recent developments in theory and experiment led us to gather together from June 27 to July 1 1994 at the Grand Hotel in Divonne les Bains France to discuss and expose the open questions and issues in our field *Quantum Electrodynamics of Strong Fields* Walter Greiner, B. Müller, J. Rafelski, 2012-12-06 The fundamental goal of physics is an understanding of the forces of nature in their simplest and most general terms Yet there is much more involved than just a basic set of equations which eventually has to be solved when applied to specific problems We have learned in recent years that the structure of the ground state of field theories
