Stage Structured Populations:

Stage-Structured Populations Bryan Manly, 2013-03-09 This book provides a review of methods for obtaining and analysing data from stage structured biological populations The topics covered are sampling designs Chapter 2 the estimation of parameters by maximum likelihood Chapter 3 the analysis of sample counts of the numbers of individuals in different stages at different times Chapters 4 and 5 the analysis of data using Leslie matrix types of model Chapter 6 and key factor analysis Chapter 7 There is also some discussion of the approaches to modelling and estimation that have been used in five studies of particular populations Chapter 8 There is a large literature on the modelling of biological populations and a multitude of different approaches have been used in this area The various approaches can be classified in different ways Southwood 1978 ch 12 but for the purposes of this book it is convenient to think of the three categories mathematical statistical and predictive modelling Mathematical modelling is concerned largely with developing models that capture the most important qualitative features of population dynamics In this case the models that are developed do not have to be compared with data from natural populations As representations of idealized systems they can be quite informative in showing the effects of changing parameters indicating what factors are most important in promoting stability and so on

Estimation of Mortality Rates in Stage-Structured Population Simon N. Wood, Roger M. Nisbet, 2013-03-08 The stated aims of the Lecture Notes in Biomathematics allow for work that is unfinished or tentative This volume is offered in that spirit The problem addressed is one of the classics of statistical ecology the estimation of mortality rates from stage frequency data but in tackling it we found ourselves making use of ideas and techniques very different from those we expected to use and in which we had no previous experience Specifically we drifted towards consideration of some rather

specific curve and surface fitting and smoothing techniques We think we have made some progress otherwise why publish but are acutely aware of the conceptual and statistical clumsiness of parts of the work Readers with sufficient expertise to be offended should regard the monograph as a challenge to do better The central theme in this book is a somewhat complex algorithm for mortality estimation detailed at the end of Chapter 4 Because of its complexity the job of implementing the method is intimidating Any reader interested in using the methods may obtain copies of our code as follows

Intelligible Structured Code 1 Hutchinson and deHoog s algorithm for fitting smoothing splines by cross validation 2 Cubic covariant area approximating splines 3 Cubic interpolating splines 4 Cubic area matching splines 5 Hyman s algorithm for monotonic interpolation based on cubic splines Prototype User Hostile Code 6 Positive constrained interpolation 7 Positive constrained area matching 8 The full method from chapter 4 9 The simpler method from chapter 4

Optimal Control of Age-structured Populations in Economy, Demography, and the Environment Raouf Boucekkine, Natali Hritonenko, Yuri Yatsenko, 2013-05-13

This book covers a wide range of topics within mathematical modelling and the optimization of economic demographic technological and environmental phenomena Each chapter is written by experts in their field and represents new advances in modelling theory and practice These essays are exemplary of the fruitful interaction between theory and practice when exploring global and local changes The unifying theme of the book is the use of mathematical models and optimization methods to describe age structured populations in economy demography technological change and the environment Emphasis is placed on deterministic dynamic models that take age or size structures delay effects and non standard decision variables into account In addition the contributions deal with the age structure of assets resources and populations under study Interdisciplinary modelling has enormous potential for discovering new insights in global and regional development

Optimal Control of Age structured Populations in Economy Demography and the Environment is a rich and excellent source of information on state of the art modelling expertise and references The book provides the necessary mathematical background for readers from different areas such as applied sciences management sciences and operations research which helps guide the development of practical models As well as this the book also surveys the current practice in applied modelling and looks at new research areas for a general mathematical audience This book will be of interest primarily to researchers postgraduate students as well as a wider scientific community including those focussing on the subjects of applied mathematics environmental sciences economics demography management and operations research
