

SOLAR SYSTEM

THE SUN'S NEIGHBORHOOD

The solar system is a family of celestial bodies that orbit the Sun, which is the central star. The system includes the Sun, eight planets, their moons, and billions of smaller objects like asteroids and comets. The planets are divided into two groups: the inner solar system (Mercury, Venus, Earth, and Mars) and the outer solar system (Jupiter, Saturn, Uranus, and Neptune). Pluto is no longer considered a planet but is still part of the solar system.

Most of the mass in the solar system is contained in the Sun, which is a yellow dwarf star. The planets are made of different materials, with the inner planets being rocky and the outer planets being gaseous. The solar system formed about 4.6 billion years ago from a cloud of gas and dust.

Mercury
 The smallest planet in the solar system, Mercury is a rocky planet with a large metal core. It has no atmosphere and no moons.

Mapping the Solar System

The solar system is a vast expanse of space, and mapping it is a complex task. Scientists use a variety of methods to map the solar system, including spacecraft, telescopes, and computer simulations. The most common method is to use spacecraft to map the orbits of the planets and other objects in the solar system. This is done by measuring the distance between the spacecraft and the Sun, and then using that information to determine the spacecraft's orbit.
