successful LTE Security addressing the security architecture for SAE LTE which is based on elements of the security architectures for GSM and 3G but which needed a major redesign due to the significantly increased complexity and different architectural and business requirements of fourth generation systems The authors explain in detail the security mechanisms employed to meet these requirements The specifications generated by standardization bodies only inform about how to implement the system and this only to the extent required for interoperability but almost never inform readers about why things are done the way they are Furthermore specifications tend to be readable only for a small group of experts and lack the context of the broader picture The book fills this gap by providing first hand information from insiders who participated in decisively shaping SAE LTE security in the relevant standardization body 3GPP and can therefore explain the rationale for design decisions in this area A concise fully updated guide to the 3GPP LTE Security Standardization specifications Describes the essential elements of LTE and SAE Security written by leading experts who participated in decisively shaping SAE LTE security in the relevant standardization body 3GPP Explains the rationale behind the standards specifications giving readers a broader understanding of the context to these specifications Includes new chapters covering 3GPP work on system enhancements for MTC plus application layer security in ETSI TC M2M and embedded smart card in ETSI SCP Security for Machine type Communication Relay Node Security and Future Challenges including Voice over LTE MTC Home base stations LIPA SIPTO and New Cryptographic Algorithms Essential reading for System engineers developers and people in technical sales working in the area of LTE and LTE security communication engineers and software developers in mobile communication field

**Wireless and Mobile Network Security** Hakima Chaouchi, Maryline

Laurent-Maknavicius, 2013-03-01 This book provides a thorough examination and analysis of cutting edge research and security solutions in wireless and mobile networks It begins with coverage of the basic security concepts and fundamentals which underpin and provide the knowledge necessary for understanding and evaluating security issues challenges and solutions This material will be of invaluable use to all those working in the network security field and especially to the many people entering the field The next area of focus is on the security issues and available solutions associated with off the shelf wireless and mobile technologies such as Bluetooth WiFi WiMax 2G and 3G There is coverage of the security techniques used to protect applications downloaded by mobile terminals through mobile cellular networks and finally the book addresses security issues and solutions in emerging wireless and mobile technologies such as ad hoc and sensor networks cellular 4G and IMS networks

*Entity Authentication and Personal Privacy in Future Cellular Systems* Geir M. Kjøien, Geir M Kjøien, 2009 In the first quarter of 2009 there were more than 4 billion subscribers to cellular phone services in the world and this number is constantly growing With this in mind it should be clear that use of mobile communication has already become both pervasive and ubiquitous It has become a global commodity really Entity Authentication and Personal Privacy in Future Cellular Systems aims at explaining and examining access security as it is found in mobile cellular systems A thorough

investigation of how access security and personal privacy is handled in the 3GPP system is conducted This includes both the 2G systems GSM GPRS and the 3G system UMTS The emerging fourth generation LTE architecture is also examined The first part of the book deals exclusively with presenting access security as found in the 3GPP system Particular attention is given to the authentication and key agreement procedures The 3GPP systems have evolved and the access security architecture in LTE is substantially more advanced and mature than what you would find in GSM GPRS but even the LTE security architecture has its limitations In part two of the book we go on to examine what is missing from the current cellular access security architectures Some of the shortcomings found in GSM GPRS and later UMTS have been partially addressed in LTE but the burden of backwards compatibility has meant that many issues could not easily be resolved Free from those restrictions we shall see that one can provide substantially improved subscriber privacy and enhanced entity authentication while also avoiding the delegated authentication control that all 3GPP systems have The design of authentication protocols is discussed in depth and this would also include looking into the role of formal verification in the design of security protocols
