**The Yellowstone Wolf** Paul Schullery, 2003 All royalties from sales of this book go to Yellowstone s wolf recovery project Few animals inspire such a mixture of fear curiosity and wonder as the wolf Highly regarded but often misunderstood the wolf has as many friends as enemies and its reintroduction into Yellowstone National Park has sparked both fascination and controversy Early in Yellowstone s history wolves were thought supernaturally evil and scores were destroyed Northern Rocky Mountain wolves were native to Yellowstone when the park was established in 1872 but predator control led to determined eradication and by the 1940s they were gone Amid much fanfare however wolves were reintroduced to one of the nation s oldest national parks in the 1990s This comprehensive reference documents the prehistory management and nature of the Yellowstone wolf Historian naturalist Paul Schullery has assembled the voices of explorers naturalists park officials tourists lawmakers and modern researchers to tell the story of what may be the most famous wolf population in the world This unique book includes numerous scientific studies of interest to wolf enthusiasts and scholars of western wildlife issues conservation and national parks In a new afterword Schullery discusses recent developments in the recovery project

**The Wolves of Yellowstone** John Weaver, 1978 Historical records and intensive field surveys 1975 77 provided information on the population history ecology and current status of wolves *Canis lupus* in Yellowstone National Park and vicinity Wolves occurred in unknown but seemingly low densities during the latter 1800s in several areas of Yellowstone where they were controlled periodically until 1926 Populations apparently began increasing about 1912 primarily in the northeast and may have reached nonequilibrium levels of 30 40 animals postwhelping Intensive control 1914 26 removed at least 136 wolves including about 80 pups During

this period Yellowstone wolves characteristically lived in packs of 3-16 members some of which followed the ungulates in their seasonal migrations Litters averaging 7-8 were born in late March and April primarily in the north central sector of the park Limited evidence suggests that elk *Cervus elaphus* were important food for wolves during all seasons Wolves either survived the control era or moved in shortly thereafter for singles pairs and a pack of four were reported the following decade Resident wolf packs however were eliminated from Yellowstone National Park by the 1940s Large canids have been sighted intermittently to the present but their identity has not been established Singles and pairs comprised 89% of 116 probable reports over the past 50 years Speculation about factors limiting the Yellowstone wolf population considers its relative geographic isolation from viable wolf populations and possible genetic problems including wolf coyote hybridization associated with prolonged minimal population status A transplant of wolves from British Columbia or Alberta or perhaps Minnesota is recommended to restore a viable population of this native predator to Yellowstone National Park
