deficiency is usually well handled by clinicians research dedicated to the neural function of thyroid hormone have not been a priority within the field This is changing mainly for two reasons First new genetic diseases have been discovered altering thyroid hormone signaling in brain THRA MCT8 SBP2 with neurodevelopmental consequences which are currently incurable Second there is a growing concern that exposition of the general population to environmental chemicals able to interfere with thyroid hormone signaling compromises children neurodevelopment or induces central disorders in adults Finally thyroid hormone is acting directly on gene transcription by binding nuclear receptors and therefore is an interesting entry point to identify genetic programs controlling brain development and function Reaching a broad understanding of the multiple processes involving thyroid hormone in brain is a tremendous task which will necessitate a multidisciplinary approach animal genetics molecular biology brain imaging developmental biology genomics etc This topic will be the occasion to combine recent contributions in the field and to identify priorities for future investigations Due to devastating consequences of congenital hypothyroidism the neurodevelopmental consequences of altered thyroid hormone signaling have been extensively studied over the years The discovery of new genetic diseases the concern about the possible neurotoxicity of environmental thyroid hormone disruptors recently renewed the interest for an important research field This Ebook gathers reviews and original data from experts in various disciplines It provides a broad view of ongoing research and outlines key issues for future investigation [Journal of Neuroscience Research](#) ,1975 [The Damaged Brain of Iodine Deficiency](#) John Bruton Stanbury,1994 **The Biological Basis of Human Nature** Herbert Spencer Jennings,1930 Preface This volume is an attempt to present those aspects of modern experimental biology that are of most interest in considering the problem of human personality and society It deals with the origin development and nature of the traits which distinguish individuals and which in man make up character and with some of the relations of these matters to social questions The material is drawn mainly from the relatively new sciences of Genetics and Experimental Embryology An effort is made to present it in non technical language though for a few important things unknown to common speech the technical terms are the only ones available The first five chapters summarize the biological foundations for the matters dealt with later They are necessarily more technical than the others they are compelled to present certain points that have not yet become familiar but which in time will be a part of the every day knowledge of all educated persons Understanding of the more general questions dealt with in later chapters depends absolutely on a grasp of the matters presented in these chapters Chapters six to eight deal with the relations of this fundamental knowledge to certain more problematical questions of life and mind chapter eight presenting certain historical aspects of these matters Chapters nine to twelve inclusive take up the application of this knowledge to some social problems Chapter thirteen stands by itself it is speculative The three final chapters are devoted to aspects of the problem of evolutionary change References to sources and other comments are gathered into notes at the end of each chapter They are designed merely as keys by which the reader may follow further any subjects which interest him
