

# Interpreting Small Animal Thoracic Radiographs

**R**adiography provides a rapid, noninvasive mechanism for evaluating structures within and surrounding the thorax. Because the changes seen on thoracic radiographs are often indicative of systemic disease (and may be non-specific), the clinician needs to keep the patient, signalment, physical examination, and other laboratory findings in mind when prioritizing the differential diagnoses.

## CONSIDERATIONS

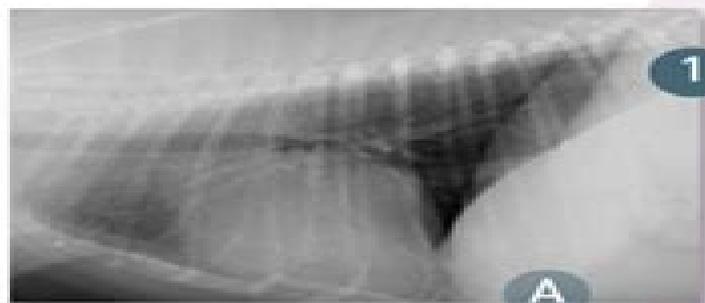

Interpretation of thoracic radiographs can be challenging because most disease processes often involve several areas of the thorax. Thoracic radiographs may be followed by a thoracic computed tomographic study to better characterize or understand the thoracic roentgen abnormalities seen.

High-quality, 3-view thoracic films that are correctly positioned should be the starting point for all practitioners. For best results, the practitioner should be actively involved in processing the images to ensure correct anatomical positioning and exposure (Figure 1). Whenever possible, more than 1 person should review films for abnormalities and roentgen changes.

## INTERPRETATION PARADIGM

Thoracic radiographs should always be evaluated in the exact same position and correct orientation (ie, left lateral, ventrodorsal or dorsoventral, and right lateral) (Figure 2, page 66). Next, the images should be evaluated using a systematic checklist of thoracic structures. The thorax can be divided into the following 4 compartments:

- Extrathoracic structures
- Pleural space

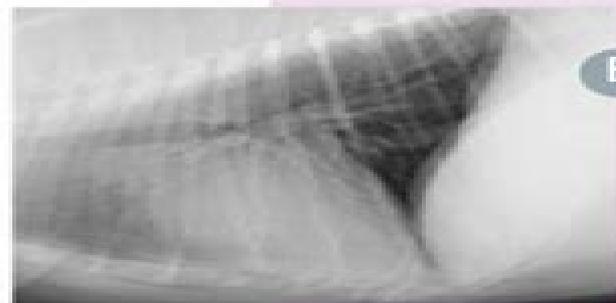

Expiratory (A) and inspiratory (B) right lateral radiographs from a 7-year-old neutered male poodle. Because the act of respiration changes the thoracic appearance, inspiratory films should be attempted to distinguish artifacts from true lung pathology.

- Pulmonary parenchyma
- Mediastinum

When reviewing films, the clinician should think in terms of radiographic opacity and use the standard roentgen sign approach. Radiographic opacities allow the interpreter to distinguish metal (white), mineral, soft tissue, fat, and air (black).

Each anatomic structure will have specific radiographic attributes that include normal size, shape, opacity, margination (contour), position (location), and number. If a structure appears "abnormal," the abnormality should be categorized according to the roentgen sign approach
