Tumescent Local Anesthesia:

Tumescent Local Anesthesia C.W. Hanke, B. Sommer, G. Sattler, 2012-12-06 It is safe to say that without Jeffrey Klein who first described tumescent local anesthesia this book would never have been written This technique of local anesthesia originally designed for use in outpatient liposuction procedures in the United States of America was introduced into clinical practice in Darmstadt in 1990 and is now employed in a growing number of areas of surgical dermatology Eight years of experience have shown it to be a particularly elegant and safe method of local anesthesia especially in the treatment of large areas of skin A large number of scientific studies have improved our understanding of tumescent local anesthesia The administration of large quantities of a dilute local anesthetic into lipophilic tissue is no longer seen as a risk to the patient although further discussion at the international level will be required over the next few years in order to standardize the tumescent solution Until then the widely varying dosages reported around the world should be regarded with caution The progress made and experience gained in recent years make it likely that tumescent local anesthesia will become firmly established in all branches of surgery One important factor is the economy of the tumescent technique the material costs of which are very low In comparison to general anesthesia enormous savings can be made in the costs of postoperative care owing to reduced staff requirements and fewer complications of wound healing

Tumescent Technique Jeffrey A. Klein, 2000 TUMESCENT TECHNIQUE is the definitive reference on all aspects of the tumescent technique of anesthesiology used in liposuction Written by the inventor of the tumescent technique this resource explains the pathophysiology complications pharmacology and the different methods used to achieve great cosmetic results Step by step instructions demonstrate how to perform this procedure on all areas of the body Complications and postoperative care are also addressed Written by Dr Klein a leading expert in the field and the physician who invented and perfected the technique Provides step by step instructions for administering the local anesthesia with a practical easy to follow approach Discusses tumescent liposuction techniques for each body region addressing procedures guidelines and complications for each Covers complications and how to avoid them preventing problems before they arise Provides detailed illustrations of techniques and before and after photographs to allow you to see expected results

Tumescent Anesthesia Solange Amaro, 2017

Background and Goal of Study Tumescent Local Anaesthesia TLA is a technique consisting of subcutaneous infiltration of large volumes of a dilute local anaesthetic solution usually lidocaine with epinephrine producing surgical area tumescence swelling and firmness It permits surgical procedures to be performed with less pain and less blood loss TLA was described in 1987 by Klein for liposuction Since then TLA has been widely used in several surgical fields TLA is a concern for anesthesiologists as the recommended maximum doses of local anaesthetic are largely surpassed by the surgeon reaching doses of 55 mg/kg of lidocaine exceeding the defined limit of 7 mg/kg

1 The anaesthesiology literature on this topic is scarce This review study aims to assess the safety evidence of TLA regarding local anaesthetic dosage

Materials and Methods A

literature review was conducted using PubMed database with no publications date restrictions using the keywords tumescence lidocaine and dosage Results and Discussion 13 articles were identified 4 published in the last 5 years TLA advantages include performance of the procedure without general anaesthesia reduction in blood loss and efficacious and extended postoperative analgesia Overall maximum safe doses of lidocaine are not consensual varying from 28 to 55 mg Kg according to the solution used addition of epinephrine and possible association with liposuction Since lidocaine absorption is very slow in this technique it is rarely associated with neurologic or cardiac toxicity However the peak of absorption of the anaesthetic solution occurs after 4 to 12 hours of infiltration and the absorption continues beyond 24 hours requiring rigorous vigilance of the patient in the immediate postoperative period In addition epinephrine toxicity can also occur 1 3 Conclusion In conclusion TLA can be considered a safe alternative or combined technique of anaesthesia and analgesia in certain procedures To maximize safety all anesthesiologists should be aware of the pharmacokinetics and toxicity of tumescent lidocaine in order to recognize and treat potential complications **Atlas of Cosmetic Surgery with DVD**
