Foundations of Empirical Software Engineering Barry Boehm, Hans Dieter Rombach, Marvin V. Zelkowitz, 2005-05-13

Although software engineering can trace its beginnings to a NATO conference in 1968 it cannot be said to have become an empirical science until the 1970s with the advent of the work of Prof Victor Robert Basili of the University of Maryland. In addition to the need to engineer software was the need to understand software. Much like other sciences such as physics, chemistry, and biology, software engineering needed a discipline of observation, theory formation, experimentation, and feedback. By applying the scientific method to the software engineering domain, Basili developed concepts like the Goal Question Metric method, the Quality Improvement Paradigm, and the Experience Factory to help bring a sense of order to the ad hoc developments so prevalent in the software engineering field. On the occasion of Basili's 65th birthday, we present this book containing reprints of 20 papers that defined much of his work. We divided the 20 papers into 6 sections, each describing a different facet of his work, and asked several individuals to write an introduction to each section. Instead of describing the scope of this book in this preface, we decided to let one of his papers, the keynote paper he gave at the International Conference on Software Engineering in 1996 in Berlin, Germany, to lead off this book. He better than we can best describe his views on what is experimental software engineering.

This tutorial is intended for students, professionals in the fields of computer science and computer engineering, designers and implementers, and data processing managers who now find RISC machines among their available processor choices.
